Proof: Consider the quotient morphism $\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A} / O^{\mathcal{A}}(T)$. $\langle I, \pi \rangle$ is surjective, with I an isomorphism, and it is O -compatible with T . By Theorem 1589, $\pi : \llbracket T \rrbracket^{O^{\mathcal{A}}} \rightarrow \llbracket T / O^{\mathcal{A}}(T) \rrbracket^{O^{\mathcal{A}} / O^{\mathcal{A}}(T)}$ is an order isomorphism with inverse π^{-1} . Since T^O is the least $\mathcal{I}$ -filter family of $\llbracket T \rrbracket^{O^{\mathcal{A}}}$, it follows that $T^O / O^{\mathcal{A}}(T)$ must be the least $\mathcal{I}$ -filter family of $\llbracket T / O^{\mathcal{A}}(T) \rrbracket^{O^{\mathcal{A}} / O^{\mathcal{A}}(T)}$, which is, by definition, $(T / O^{\mathcal{A}}(T))^O$. Finally, since $O^{\mathcal{A} / O^{\mathcal{A}}(T)}(T / O^{\mathcal{A}}(T)) = \Delta^{\mathcal{A} / O^{\mathcal{A}}(T)}$, it follows that $\llbracket T / O^{\mathcal{A}}(T) \rrbracket^{O^{\mathcal{A}} / O^{\mathcal{A}}(T)} = \text{FiFam}^{\mathcal{I}}(\mathcal{A} / O^{\mathcal{A}}(T))$. Thus, $(T / O^{\mathcal{A}}(T))^O$ is the least $\mathcal{I}$ -filter family on $\mathcal{A} / O^{\mathcal{A}}(T)$. ■

Finally, applying the General Correspondence Theorem to the relativization of an operator, we obtain the following:

Theorem 1592 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $O = \{O^{\mathcal{A}} : \mathcal{A} \in \text{AlgSys}(\mathbf{F})\}$ a semi-coherent family of compatibility $\mathcal{I}$ -operators. Then, for all $\mathbf{F}$ -algebraic systems $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$, all surjective morphisms $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$, with H an isomorphism, and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, if $\langle H, \gamma \rangle$ is $\tilde{O}^{\mathcal{I}}$ -compatible with T , then γ induces an order isomorphism from $\llbracket T \rrbracket^{\tilde{O}^{\mathcal{I}}, \mathcal{A}}$ onto $\llbracket \gamma(T) \rrbracket^{\tilde{O}^{\mathcal{I}}, \mathcal{B}}$, with inverse γ^{-1} .*

Proof: It is clear that if O is a compatibility $\mathcal{I}$ -operator, the same holds for $\tilde{O}^{\mathcal{I}}$. Moreover, by Proposition 1581, if O is a semi-coherent family, then $\tilde{O}^{\mathcal{I}}$ is also semi-coherent. Therefore, under the given hypotheses, we can apply Theorem 1589 with $\tilde{O}^{\mathcal{I}}$ in place of O and the result immediately follows. ■

21.9 Algebraic Systems of $\mathcal{I}$ -Operators

With a given family of congruential operators, there are associated several classes of algebraic systems, which it is the purpose of this section to study closely, in analogy to the various classes ensued from applications of the Leibniz operator, and to explore their interrelationships.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $O = \{O^{\mathcal{A}} : \mathcal{A} \in \text{AlgSys}(\mathbf{F})\}$ a family of congruential $\mathcal{I}$ -operators. We define the following classes of $\mathbf{F}$ -algebraic systems associated with O (assuming closure under isomorphisms):

- $\text{AlgSys}^O(\mathcal{I}) = \{\mathcal{A}/O^{\mathcal{A}}(T) : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})\};$
- $\text{AlgSys}_O(\mathcal{I}) = \{\mathcal{A} \in \text{AlgSys}(\mathbf{F}) : (\exists T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}))(O^{\mathcal{A}}(T) = \Delta^{\mathcal{A}})\};$
- $\text{AlgSys}^{\tilde{O}^{\mathcal{I}}}(\mathcal{I}) = \{\mathcal{A}/\tilde{O}^{\mathcal{I},\mathcal{A}}(T) : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})\};$
- $\text{AlgSys}_{\tilde{O}^{\mathcal{I}}}(\mathcal{I}) = \{\mathcal{A} \in \text{AlgSys}(\mathbf{F}) : (\exists T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}))(\tilde{O}^{\mathcal{I},\mathcal{A}}(T) = \Delta^{\mathcal{A}})\};$
- $\text{AlgSys}^{\tilde{O}}(\mathcal{I}) = \{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), \mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})\};$
- $\text{AlgSys}_{\tilde{O}}(\mathcal{I}) = \{\mathcal{A} \in \text{AlgSys}(\mathbf{F}) : (\exists \mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A}))(\tilde{O}^{\mathcal{A}}(\mathcal{T}) = \Delta^{\mathcal{A}})\}.$

Names corresponding to these classes go as follows:

- $\text{AlgSys}^O(\mathcal{I})$ is the class of **O -reduced $\mathbf{F}$ -algebraic systems**;
- $\text{AlgSys}_O(\mathcal{I})$ is the class of **O -reductions of $\mathbf{F}$ -algebraic systems**;
- $\text{AlgSys}^{\tilde{O}^{\mathcal{I}}}(\mathcal{I})$ is the class of **$\tilde{O}^{\mathcal{I}}$ -reduced $\mathbf{F}$ -algebraic systems**;
- $\text{AlgSys}_{\tilde{O}^{\mathcal{I}}}(\mathcal{I})$ is the class of **$\tilde{O}^{\mathcal{I}}$ -reductions of $\mathbf{F}$ -algebraic systems**;
- $\text{AlgSys}^{\tilde{O}}(\mathcal{I})$ is the class of **$\tilde{O}$ -reduced $\mathbf{F}$ -algebraic systems**;
- $\text{AlgSys}_{\tilde{O}}(\mathcal{I})$ is the class of **$\tilde{O}$ -reductions of $\mathbf{F}$ -algebraic systems**.

We provide some alternative characterizations for the classes associated with the lifting $\tilde{O}$ of the operator O .

Lemma 1593 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $O = \{O^{\mathcal{A}} : \mathcal{A} \in \text{AlgSys}(\mathbf{F})\}$ a family of congruential $\mathcal{I}$ -operators.*

- (a) $\text{AlgSys}^{\tilde{O}}(\mathcal{I}) = \{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), \mathcal{T} \text{ } O^{\mathcal{A}}\text{-full}\};$
- (b) $\text{AlgSys}_{\tilde{O}}(\mathcal{I}) = \{\mathcal{A} : \tilde{O}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}\};$
- (c) $\text{AlgSys}_{\tilde{O}}(\mathcal{I}) = \{\mathcal{A} : (\exists \mathcal{T} \text{ } O^{\mathcal{A}}\text{-full})(\tilde{O}^{\mathcal{A}}(\mathcal{T}) = \Delta^{\mathcal{A}})\}.$

Proof: Note that, for all three equalities claimed, the right-to-left inclusions are trivial, given the definitions of the corresponding classes on the left. Therefore, in working out the various parts, it suffices to show the left-to-right inclusions.

- (a) Suppose that $\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) \in \text{AlgSys}^{\tilde{O}}(\mathcal{I})$, for some $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Since $\tilde{O}^{\mathcal{A}}(\mathcal{T})$ is by definition, an O -full congruence system on $\mathcal{A}$, there exists, by Corollary 1558, an O -full $\mathcal{T}' \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{O}^{\mathcal{A}}(\mathcal{T}') = \tilde{O}^{\mathcal{A}}(\mathcal{T})$. Thus, we get $\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) = \mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}') \in \{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), \mathcal{T} \text{ } O^{\mathcal{A}}\text{-full}\}.$

- (b) Assume $\mathcal{A} \in \text{AlgSys}_{\tilde{O}}(\mathcal{I})$. Then, by definition, there exists a collection $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{O}^{\mathcal{A}}(\mathcal{T}) = \Delta^{\mathcal{A}}$. Therefore,

$$\tilde{O}^{\mathcal{A}}(\text{FiFam}^{\mathcal{A}}(\mathcal{A})) \leq \tilde{O}^{\mathcal{A}}(\mathcal{T}) = \Delta^{\mathcal{A}}.$$

Thus, $\tilde{O}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$. We get that $\mathcal{A} \in \{\mathcal{A} : \tilde{O}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}\}$.

- (c) This follows directly from Part (b) and Corollary 1560. ■

We now show that the three pairs of classes of reduced - classes of reductions, associated with the same operator, consist of identical classes of $\mathbf{F}$ -algebraic systems. This is due to the fact that the reduction of an $\mathbf{F}$ -algebraic system results in a reduced $\mathbf{F}$ -algebraic system, taken with respect to the same operator.

Lemma 1594 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $O = \{O^{\mathcal{A}} : \mathcal{A} \in \text{AlgSys}(\mathbf{F})\}$ a semi-coherent family of congruential compatibility $\mathcal{I}$ -operators and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system. For all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and all $\theta \in \text{ConSys}(\mathcal{A})$,*

$$\theta \leq O^{\mathcal{A}}(T) \quad \text{implies} \quad O^{\mathcal{A}/\theta}(T/\theta) = O^{\mathcal{A}}(T)/\theta.$$

In particular, $O^{\mathcal{A}/O^{\mathcal{A}}(T)}(T/O^{\mathcal{A}}(T)) = \Delta^{\mathcal{A}/O^{\mathcal{A}}(T)}$.

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and $\theta \in \text{ConSys}(\mathcal{A})$, such that $\theta \leq O^{\mathcal{A}}(T)$. Consider the quotient morphism $\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\theta$. It is surjective and, by hypothesis, O -compatible with T . By the assumption of semi-coherence and Lemma 1579, we get

$$O^{\mathcal{A}/\theta}(T/\theta) = O^{\mathcal{A}/\theta}(\pi(T)) = \pi(O^{\mathcal{A}}(T)) = O^{\mathcal{A}}(T)/\theta.$$

The last assertion in the statement is the specialization of what was just proven for $\theta = O^{\mathcal{A}}(T)$. ■

Proposition 1595 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, and $O = \{O^{\mathcal{A}} : \mathcal{A} \in \text{AlgSys}(\mathbf{F})\}$ a semi-coherent family of congruential compatibility $\mathcal{I}$ -operators. Then*

$$\text{AlgSys}^O(\mathcal{I}) = \text{AlgSys}_O(\mathcal{I}).$$

Proof: Suppose $\mathcal{A} \in \text{AlgSys}_O(\mathcal{I})$. Then, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $O^{\mathcal{A}}(T) = \Delta^{\mathcal{A}}$. But then $\mathcal{A} \cong \mathcal{A}/\Delta^{\mathcal{A}} = \mathcal{A}/O^{\mathcal{A}}(T) \in \text{AlgSys}^O(\mathcal{I})$.

On the other hand, if $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ so that $\mathcal{A}/O^{\mathcal{A}}(T) \in \text{AlgSys}^O(\mathcal{I})$, then, for $T/O^{\mathcal{A}}(T) \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}/O^{\mathcal{A}}(T))$, we get, by Lemma 1594,

$$O^{\mathcal{A}/O^{\mathcal{A}}(T)}(T/O^{\mathcal{A}}(T)) = \Delta^{\mathcal{A}/O^{\mathcal{A}}(T)},$$

whence, by definition $\mathcal{A}/O^{\mathcal{A}}(T) \in \text{AlgSys}_O(\mathcal{I})$. ■

Corollary 1596 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, and $O = \{O^A : A \in \text{AlgSys}(\mathbf{F})\}$ a semi-coherent family of congruential compatibility $\mathcal{I}$ -operators. Then*

$$\text{AlgSys}^{\tilde{O}^{\mathcal{I}}}(\mathcal{I}) = \text{AlgSys}_{\tilde{O}^{\mathcal{I}}}(\mathcal{I}).$$

Proof: By Proposition 1581 together with Proposition 1595. ■

Lemma 1597 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $O = \{O^A : A \in \text{AlgSys}(\mathbf{F})\}$ a semi-coherent family of congruential compatibility $\mathcal{I}$ -operators and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system. For all $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$*

$$\tilde{O}^{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T})}(\mathcal{T}/\tilde{O}^{\mathcal{A}}(\mathcal{T})) = \Delta^{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T})}.$$

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Consider the quotient morphism $\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T})$. It is surjective and O -compatible with $\mathcal{T}$. By the assumption of semi-coherence and Proposition 1583, we get

$$\begin{aligned} \tilde{O}^{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T})}(\mathcal{T}/\tilde{O}^{\mathcal{A}}(\mathcal{T})) &= \tilde{O}^{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T})}(\pi(\mathcal{T})) \\ &= \pi(\tilde{O}^{\mathcal{A}}(\mathcal{T})) \\ &= \tilde{O}^{\mathcal{A}}(\mathcal{T})/\tilde{O}^{\mathcal{A}}(\mathcal{T}) \\ &= \Delta^{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T})}. \end{aligned}$$

This concludes the proof of the statement. ■

Proposition 1598 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, and $O = \{O^A : A \in \text{AlgSys}(\mathbf{F})\}$ a semi-coherent family of congruential compatibility $\mathcal{I}$ -operators. Then*

$$\text{AlgSys}^{\tilde{O}}(\mathcal{I}) = \text{AlgSys}_{\tilde{O}}(\mathcal{I}).$$

Proof: Suppose $\mathcal{A} \in \text{AlgSys}_{\tilde{O}}(\mathcal{I})$. Then, there exists $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{O}^{\mathcal{A}}(\mathcal{T}) = \Delta^{\mathcal{A}}$. But then $\mathcal{A} \cong \mathcal{A}/\Delta^{\mathcal{A}} = \mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) \in \text{AlgSys}^{\tilde{O}}(\mathcal{I})$.

On the other hand, if $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ so that $\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) \in \text{AlgSys}^{\tilde{O}}(\mathcal{I})$, then, for $\mathcal{T}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}))$, we get, by Lemma 1597,

$$\tilde{O}^{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T})}(\mathcal{T}/\tilde{O}^{\mathcal{A}}(\mathcal{T})) = \Delta^{\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T})},$$

whence, by definition $\mathcal{A}/\tilde{O}^{\mathcal{A}}(\mathcal{T}) \in \text{AlgSys}_{\tilde{O}}(\mathcal{I})$. ■

Proposition 1599 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, and $O = \{O^A : A \in \text{AlgSys}(\mathbf{F})\}$ a semi-coherent family of congruential compatibility $\mathcal{I}$ -operators. Then*

$$\text{AlgSys}^{\tilde{O}}(\mathcal{I}) = \text{AlgSys}_{\tilde{O}}(\mathcal{I}) = \text{AlgSys}^{\tilde{O}^{\mathcal{I}}}(\mathcal{I}) = \text{AlgSys}_{\tilde{O}^{\mathcal{I}}}(\mathcal{I}).$$

Proof: For every $\mathbf{F}$ -algebraic system and every $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we have $\tilde{\mathcal{O}}^{\mathcal{I}, \mathcal{A}}(T) = \tilde{\mathcal{O}}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T)$. This equality gives that

$$\text{AlgSys}_{\tilde{\mathcal{O}}^{\mathcal{I}}}(\mathcal{I}) \subseteq \text{AlgSys}_{\tilde{\mathcal{O}}}(\mathcal{I}) \quad \text{and} \quad \text{AlgSys}_{\tilde{\mathcal{O}}^{\mathcal{I}}}(\mathcal{I}) \subseteq \text{AlgSys}_{\tilde{\mathcal{O}}}(\mathcal{I}).$$

Assume, conversely, in the first case, that $\text{AlgSys}_{\tilde{\mathcal{O}}}(\mathcal{I})$. By Lemma 1593, $\tilde{\mathcal{O}}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$. Let $T = \cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then we get

$$\tilde{\mathcal{O}}^{\mathcal{I}, \mathcal{A}}(T) = \tilde{\mathcal{O}}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T) = \tilde{\mathcal{O}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}.$$

This shows that $\mathcal{A} \in \text{AlgSys}_{\tilde{\mathcal{O}}^{\mathcal{I}}}(\mathcal{I})$. Due to Corollary 1596 and Proposition 1598 the equality just proven suffices to guarantee the conclusion. ■

21.10 Leibniz Operator as an $\mathcal{I}$ -Operator

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. We consider in this section the Leibniz operator

$$\Omega = \{ \Omega^{\mathcal{A}} : \mathcal{A} \in \text{AlgSys}(\mathbf{F}) \},$$

which is a coherent, congruential, compatibility $\mathcal{I}$ -operator. We saw that its lifting is the Tarski operator $\tilde{\Omega}$ and its relativization is the Suszko operator $\tilde{\Omega}^{\mathcal{I}}$. Using the definition, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $\theta \in \text{ConSys}(\mathcal{A})$, we have

$$\begin{aligned} \Omega^{\mathcal{A}^{-1}}(\theta) &= \{ T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \theta \leq \Omega^{\mathcal{A}}(T) \} \\ &= \{ T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \theta \text{ is compatible with } T \}. \end{aligned}$$

We have the following characterizations of Ω -full objects:

Proposition 1600 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. $\mathcal{T}$ is Ω -full if and only if $\langle \mathcal{A}, \mathcal{T} \rangle$ is a full $\mathcal{I}$ -structure.*

Proof: We have

$$\begin{aligned} \mathcal{T} \text{ is } \Omega\text{-full} &\text{ iff } \mathcal{T} = \Omega^{\mathcal{A}^{-1}}(\tilde{\Omega}^{\mathcal{A}}(\mathcal{T})) \\ &\quad \text{(by definition of } \Omega\text{-full)} \\ &\text{ iff } \mathcal{T} = \{ T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T') \} \\ &\quad \text{(by definition of } \Omega^{\mathcal{A}^{-1}}) \\ &\text{ iff } \langle \mathcal{A}, \mathcal{T} \rangle \text{ is a full } \mathcal{I}\text{-structure.} \\ &\quad \text{(by Theorem 1432)} \end{aligned}$$

■

Recall that $\text{ConSys}^{\mathcal{I}}(\mathcal{A})$ denotes the collection of all $\text{AlgSys}(\mathcal{I})$ -congruence systems on an $\mathbf{F}$ -algebraic system $\mathcal{A}$, i.e., those congruence systems θ on $\mathcal{A}$, such that $\mathcal{A}/\theta \in \text{ConSys}(\mathcal{I})$. For Ω -full congruence systems, we get

Proposition 1601 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $\theta \in \text{ConSys}(\mathcal{A})$. θ is Ω -full if and only if $\theta \in \text{ConSys}^{\mathcal{I}}(\mathcal{A})$.*

Proof: We have

$$\begin{aligned} \theta \text{ is } \Omega\text{-full} & \text{ iff } \tilde{\Omega}^{\mathcal{A}/\theta}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}/\theta} \\ & \text{(by Proposition 1587)} \\ & \text{iff } \mathcal{A}/\theta \in \text{AlgSys}(\mathcal{I}) \\ & \text{(by Proposition 1436)} \\ & \text{iff } \theta \in \text{ConSys}(\mathcal{A}). \\ & \text{(by definition).} \end{aligned}$$

■

As a corollary of these two characterizations, we can derive from our work on Galois connections (more precisely Corollary 1558) the Isomorphism Theorem 1445 between full $\mathcal{I}$ -structures and $\mathcal{I}$ -congruence systems.

Corollary 1602 (Isomorphism Theorem 1445) *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system. The operators $\tilde{\Omega}^{\mathcal{A}}$ and $\Omega^{\mathcal{A}^{-1}}$ establish a Galois connection between $\mathcal{P}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}))$ and $\text{EqvFam}(\mathcal{A})$, which restricts to mutually inverse isomorphisms between $\langle \text{FStr}^{\mathcal{I}}(\mathcal{A}), \leq \rangle$ and $\langle \text{ConSys}^{\mathcal{I}}(\mathcal{A}), \leq \rangle$.*

Proof: By Corollary 1558 and Propositions 1600 and 1601, noting that the order on $\langle \text{FStr}^{\mathcal{I}}(\mathcal{A}), \leq \rangle$ is the converse from that inherited by $\langle \mathcal{P}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})), \subseteq \rangle$.

■

By applying Proposition 1559 to the Leibniz operator, we get a characterization of full $\mathcal{I}$ -structures.

Proposition 1603 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. $\langle \mathcal{A}, \mathcal{T} \rangle$ is a full $\mathcal{I}$ -structure if and only if $\mathcal{T}$ is the largest collection $\mathcal{D} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) = \tilde{\Omega}^{\mathcal{A}}(\mathcal{T})$.*

Proof: By instantiating Proposition 1559 to the Leibniz operator.

■

Moreover, directly from Lemma 1555, we get:

Proposition 1604 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is protoalgebraic if and only if $\tilde{\Omega}^{\mathcal{I}} = \Omega$.*

Proof: By instantiating Lemma 1555 to the Leibniz operator.

■

We turn now to Ω -classes and Ω -filter families. Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

The Ω -class of T or **Leibniz class of T** is

$$[[T]]^* := \Omega^{\mathcal{A}^{-1}}(\Omega^{\mathcal{A}}(T)) = \{T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\}.$$

The **Leibniz filter family of T** is the $\mathcal{I}$ -filter family

$$T^* = \bigcap [[T]]^*.$$

We say that T is a **Leibniz filter family** if $T^* = T$. The collection of all Leibniz filter families of $\mathcal{A}$ is denoted by $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$.

We further denote by $[T]$ the **equi-Leibniz class of T** , i.e., the collection of all $\mathcal{I}$ -filter families of $\mathcal{A}$ that share the same Leibniz congruence system with T :

$$[T] = \{T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \Omega^{\mathcal{A}}(T') = \Omega^{\mathcal{A}}(T)\} \subseteq [[T]]^*.$$

Some basic properties involving these concepts follow.

Lemma 1605 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

- (a) $T^* \leq \bigcap [T] \leq T$;
- (b) If $T^* = T$, then $T = \bigcap [T]$;
- (c) If $\mathcal{I}$ is protoalgebraic, then $T = T^*$ if and only if $T = \bigcap [T]$.

Proof:

- (a) We have $T^* = \bigcap [[T]]^* \leq \bigcap [T] \leq T$.
- (b) If $T^* = T$, then, by Part (a), $T = \bigcap [T]$.
- (c) Suppose that $\mathcal{I}$ is protoalgebraic. The necessity is given by Part (b). For the sufficiency, assume that $T = \bigcap [T]$. Since, by Part (a), $T^* \leq T$, by protoalgebraicity, $\Omega^{\mathcal{A}}(T^*) \leq \Omega^{\mathcal{A}}(T)$. Since $T^* \in [[T]]^*$, we get, by definition, $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^*)$. Hence, $\Omega^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(T^*)$ and, therefore, $T^* \in [T]$. Now we conclude that $T = \bigcap [T] \leq T^*$. By Part (a), the reverse inclusion always holds. ■

Proposition 1606 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

- (a) $\langle \mathcal{A}, [[T]]^* \rangle \in \text{FStr}(\mathcal{I})$;
- (b) $\tilde{\Omega}^{\mathcal{A}}([T]^*) = \Omega^{\mathcal{A}}(T)$.

Proof: By Proposition 1600, $\langle \mathcal{A}, \llbracket T \rrbracket^* \rangle$ is a full $\mathcal{I}$ -structure. Since $T \in \llbracket T \rrbracket^*$, it follows that $\tilde{\Omega}^{\mathcal{A}}(\llbracket T \rrbracket^*) \leq \Omega^{\mathcal{A}}(T)$. On the other hand, for all $T' \in \llbracket T \rrbracket^*$, $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. Thus, $\Omega^{\mathcal{A}}(T) \leq \bigcap_{T' \in \llbracket T \rrbracket^*} \Omega^{\mathcal{A}}(T') = \tilde{\Omega}^{\mathcal{A}}(\llbracket T \rrbracket^*)$. ■

It turns out that, for every theory family, its Leibniz counterpart is in fact a Leibniz theory family.

Proposition 1607 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then $T^* \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$.*

Proof: By Lemma 1605, we have $(T^*)^* \leq T^*$. On the other hand, $T^* \in \llbracket T \rrbracket^*$. So, by definition $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^*)$. This shows that $\llbracket T^* \rrbracket^* \subseteq \llbracket T \rrbracket^*$. This, in turn, yields $T^* = \bigcap \llbracket T \rrbracket^* \leq \bigcap \llbracket T^* \rrbracket^* = (T^*)^*$. We conclude that $(T^*)^* = T^*$ and, hence, $T^* \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. ■

We also have a characterization of Leibniz filter families in terms of full structures.

Proposition 1608 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$ if and only if, there exists $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}^{\mathcal{I}}(\mathcal{A})$, such that $T = \bigcap \mathcal{T}$.*

Proof: Suppose, first, that $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. Then $T = T^* = \bigcap \llbracket T \rrbracket^*$ and, by Proposition 1606, $\langle \mathcal{A}, \llbracket T \rrbracket^* \rangle$ is a full $\mathcal{I}$ -structure.

Assume, conversely, that $T = \bigcap \mathcal{T}$, with $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$. Since $T = \bigcap \mathcal{T} \in \mathcal{T}$, we get $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \leq \Omega^{\mathcal{A}}(T)$. Thus, we get

$$\llbracket T \rrbracket^* = \Omega^{\mathcal{A}^{-1}}(\Omega^{\mathcal{A}}(T)) \subseteq \Omega^{\mathcal{A}^{-1}}(\tilde{\Omega}^{\mathcal{A}}(T)) = \mathcal{T}.$$

So $T = \bigcap \mathcal{T} \leq \bigcap \llbracket T \rrbracket^* = T^*$. Since, by Lemma 1605, $T^* \leq T$, we conclude that $T^* = T$ and, hence, $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. ■

Corollary 1591, applied to the Leibniz operator, gives another characterization of Leibniz filter families.

Proposition 1609 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$ if and only if $T/\Omega^{\mathcal{A}}(T)$ is the least filter family in $\text{FiFam}^{\mathcal{I}}(\mathcal{A}/\Omega^{\mathcal{A}}(T))$.*

Proof: By specializing Corollary 1591 to the Leibniz operator. ■

Leibniz filter families may also be used in characterizing the reflectivity of the Leibniz operator, which characterizes family reflective π -institutions.

Proposition 1610 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Ω is reflective if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\text{FiFam}^{\mathcal{I}*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

Proof: We have that Ω is reflective if and only if, by definition, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,

$$\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T') \quad \text{implies} \quad T \leq T',$$

if and only if, by definition of $\llbracket T \rrbracket^*$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T' \in \llbracket T \rrbracket^*$ implies $T \leq T'$, if and only if, since $T^* = \min \llbracket T \rrbracket^*$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T = T^*$, if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. ■

Surjective morphisms between algebraic systems, with isomorphic signature components, that satisfy a compatibility condition, induce order isomorphisms between Leibniz classes, which restrict to order isomorphisms between equi-Leibniz classes.

Theorem 1611 (Correspondence Theorem for Leibniz Classes) *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ two $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. If $\langle H, \gamma \rangle$ is Ω -compatible with T , then γ induces an order isomorphism from $\llbracket T \rrbracket^*$ onto $\llbracket \gamma(T) \rrbracket^*$, with inverse γ^{-1} . In addition, for all $T' \in \llbracket T \rrbracket^*$, γ induces an order isomorphism from $\llbracket T' \rrbracket$ onto $\llbracket \gamma(T') \rrbracket$.*

Proof: The first statement follows from the General Correspondence Theorem 1589 by instantiation to the Leibniz operator. So we undertake the proof of the additional statement. Suppose that $T', T'' \in \llbracket T \rrbracket^*$. Since $T' \in \llbracket T \rrbracket^*$, we get $\llbracket T' \rrbracket \subseteq \llbracket T' \rrbracket^* \subseteq \llbracket T \rrbracket^*$. Thus, by the first statement, $\gamma^{-1}(\gamma(T')) = T'$ and $\gamma^{-1}(\gamma(T'')) = T''$. Thus, we get

$$\begin{aligned} \Omega^{\mathcal{A}}(T'') = \Omega^{\mathcal{A}}(T') & \quad \text{iff} \quad \Omega^{\mathcal{A}}(\gamma^{-1}(\gamma(T''))) = \Omega^{\mathcal{A}}(\gamma^{-1}(\gamma(T'))) \\ & \quad \text{iff} \quad \gamma^{-1}(\Omega^{\mathcal{B}}(\gamma(T''))) = \gamma^{-1}(\Omega^{\mathcal{B}}(\gamma(T'))) \\ & \quad \text{iff} \quad \Omega^{\mathcal{B}}(\gamma(T'')) = \Omega^{\mathcal{B}}(\gamma(T')). \end{aligned}$$

So $T'' \in \llbracket T' \rrbracket$ if and only if $\gamma(T'') \in \llbracket \gamma(T') \rrbracket$. Thus, the order isomorphism $\gamma : \llbracket T \rrbracket^* \rightarrow \llbracket \gamma(T) \rrbracket^*$ restricts to an order isomorphism $\gamma : \llbracket T \rrbracket \rightarrow \llbracket \gamma(T) \rrbracket$. ■

As a consequence of Correspondence Theorem, we get a correspondence between Leibniz filter families.

Corollary 1612 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ two $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. If $\langle H, \gamma \rangle$ is Ω -compatible with T , then*

$$T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \quad \text{iff} \quad \gamma(T) \in \text{FiFam}^{\mathcal{I}*}(\mathcal{B}).$$

Proof: By Theorem 1611, under the isomorphism $\gamma : \llbracket T \rrbracket^* \rightarrow \llbracket \gamma(T) \rrbracket^*$, the least theory family T^* of $\llbracket T \rrbracket^*$ corresponds to the least theory family $\gamma(T)^*$ of $\llbracket \gamma(T) \rrbracket^*$. Therefore, $T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$ if and only if $T = T^*$ if and only if $\gamma(T) = \gamma(T)^*$ if and only if $\gamma(T) \in \text{FiFam}^{\mathcal{I}*}(\mathcal{B})$. ■

Rephrased in terms of strict surjective morphisms Corollary 1612 yields

Corollary 1613 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ two $\mathbf{F}$ -algebraic systems, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T' \in \text{FiFam}^{\mathcal{A}}(\mathcal{B})$ and $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$ a strict surjective morphism, with H an isomorphism. Then*

$$T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \quad \text{iff} \quad T' \in \text{FiFam}^{\mathcal{I}*}(\mathcal{B}).$$

Proof: It suffices to show that $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ is Ω -compatible with T . If that is the case, then, since $T = \gamma^{-1}(T')$, we get, $T' = \gamma(\gamma^{-1}(T')) = \gamma(T)$, and the statement follows by applying Corollary 1612. We have, indeed

$$\begin{aligned} \text{Ker}(\langle H, \gamma \rangle) &= \gamma^{-1}(\Delta^{\mathcal{B}}) \\ &\leq \gamma^{-1}(\Omega^{\mathcal{B}}(T')) \\ &= \Omega^{\mathcal{A}}(\gamma^{-1}(T')) \\ &= \Omega^{\mathcal{A}}(T). \end{aligned}$$

Therefore, $\langle H, \gamma \rangle$ is indeed compatible with T . ■

The Correspondence Theorem 1611 allows us to formulate a Correspondence Theorem for the special case of protoalgebraic π -institutions that, as it turns out, provides an additional characterization of protoalgebraicity.

Theorem 1614 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is protoalgebraic if and only if, for all $\mathbf{F}$ -algebraic systems $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$, all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and every strict surjective morphism $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$, with H an isomorphism, γ induces an order isomorphism from $\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$ onto $\text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$, with inverse γ^{-1} .*

Proof: Suppose, first, that $\mathcal{I}$ is protoalgebraic and let $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$ be a strict surjective morphism, with H an isomorphism. Then, we get $T = \gamma^{-1}(T')$ and $T' = \gamma(\gamma^{-1}(T')) = \gamma(T)$. So $T = \gamma^{-1}(\gamma(T))$. This implies that $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ is compatible with T . By the Correspondence Theorem for Leibniz Classes 1611, γ induces an order isomorphism $\gamma : \llbracket T \rrbracket^* \rightarrow \llbracket T' \rrbracket^*$, with inverse γ^{-1} . But, by protoalgebraicity, $\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$ and $\text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$ are upsets of $\llbracket T \rrbracket^*$ and $\llbracket T' \rrbracket^*$, respectively and T corresponds to T' under γ . Therefore, γ restricts to an order isomorphism $\gamma : \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rightarrow \text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$, with inverse γ^{-1} .

Suppose, conversely, that the given condition holds. Let $T, T' \in \text{ThFam}(\mathcal{I})$, such that $T \leq T'$. Consider the quotient morphism $\langle I, \pi \rangle : \mathcal{F} \rightarrow \mathcal{F}/\Omega(T)$. It gives a strict surjective morphism

$$\langle I, \pi \rangle : \langle \mathcal{F}, T \rangle \rightarrow \langle \mathcal{F}/\Omega(T), T/\Omega(T) \rangle.$$

Since, by hypothesis, $\pi : \text{FiFam}^{\mathcal{I}}(\mathcal{F})^T \rightarrow \text{FiFam}^{\mathcal{I}}(\mathcal{F}/\Omega(T))^{T/\Omega(T)}$ is an order isomorphism. with inverse π^{-1} and, clearly, $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{F})^T$, we get that $\pi(T') \in \text{FiFam}^{\mathcal{I}}(\mathcal{F}/\Omega(T))^{T/\Omega(T)}$ and $T' = \pi^{-1}(\pi(T'))$. Now we get

$$\begin{aligned} \Omega(T) &= \text{Ker}(\langle I, \pi \rangle) \\ &= \pi^{-1}(\Delta^{\mathcal{F}/\Omega(T)}) \\ &\leq \pi^{-1}(\Omega^{\mathcal{F}/\Omega(T)}(\pi(T'))) \\ &= \Omega(\pi^{-1}(\pi(T'))) \\ &= \Omega(T'). \end{aligned}$$

Since Ω is monotone, we conclude that $\mathcal{I}$ is a protoalgebraic π -institution. ■

Now we get a characterization of those full $\mathcal{I}$ -structures whose closure families are Leibniz classes.

Proposition 1615 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathcal{T} \rangle$ is a full $\mathcal{I}$ -structure. Then $\mathcal{T} = \llbracket T \rrbracket^*$, for some $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, if and only if $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \in \text{AlgSys}^*(\mathcal{I})$.*

Proof: Suppose, first, that $\mathcal{T} = \llbracket T \rrbracket^*$, for some $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, using Proposition 1606, we get

$$\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \tilde{\Omega}^{\mathcal{A}}(\llbracket T \rrbracket^*) = \Omega^{\mathcal{A}}(T).$$

Therefore, $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \mathcal{A}/\Omega^{\mathcal{A}}(T) \in \text{AlgSys}^*(\mathcal{I})$.

Assume, conversely, that $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \in \text{AlgSys}^*(\mathcal{I})$. By definition, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}))$, such that $\Omega^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T})}(T) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T})}$. This equality implies that $\llbracket T \rrbracket^* = \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}))$. Now consider the quotient morphism $\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T})$. Since, by hypothesis $\langle \mathcal{A}, \mathcal{T} \rangle$ is a full $\mathcal{I}$ -structure, we get

$$\mathcal{T} = \pi^{-1}(\mathcal{T}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T})) = \pi^{-1}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}))) = \pi^{-1}(\llbracket T \rrbracket^*).$$

Moreover,

$$\text{Ker}(\langle I, \pi \rangle) = \pi^{-1}(\Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T})}) = \pi^{-1}(\Omega^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T})}(T)) = \Omega^{\mathcal{A}}(\pi^{-1}(T)).$$

So $\langle I, \pi \rangle$ is Ω -compatible with $\pi^{-1}(T)$. By the Correspondence Theorem for Leibniz Classes 1611, we get an order isomorphism $\pi : \llbracket \pi^{-1}(T) \rrbracket^* \rightarrow \llbracket T \rrbracket^*$. This gives $\mathcal{T} = \pi^{-1}(\llbracket T \rrbracket^*) = \llbracket \pi^{-1}(T) \rrbracket^*$. ■

We get, as a consequence, a characterization of those π -institutions for which all full $\mathcal{I}$ -structures are determined by Leibniz classes of $\mathcal{I}$ -filter families.

Proposition 1616 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathbf{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, [T]^* \rangle : T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \}$ if and only if $\mathbf{AlgSys}(\mathcal{I}) = \mathbf{AlgSys}^*(\mathcal{I})$.*

Proof: Suppose, first, that, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\mathbf{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, [T]^* \rangle : T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \}$. Since $\mathbf{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{AlgSys}(\mathcal{I})$ holds in general, it suffices to show the reverse inclusion. To this end, let $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I})$. Thus, there exists $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Delta^{\mathcal{A}}$. Since $[T]^{\tilde{\Omega}^{\mathcal{I}}}$ $\in$ $\mathbf{FStr}^{\mathcal{I}}(\mathcal{A})$, we get, by hypothesis, $T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $[T]^{\tilde{\Omega}^{\mathcal{I}}} = [T']^*$. Now notice the following:

- $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T \subseteq [T]^{\tilde{\Omega}^{\mathcal{I}}}$, whence $\Omega^{\mathcal{A}}(T') \leq \bigcap_{T \leq T''} \Omega^{\mathcal{A}}(T'') = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$;
- $T' \in [T']^*$ implies $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$.

We conclude that $\Omega^{\mathcal{A}}(T') = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Delta^{\mathcal{A}}$. Hence, we have $\mathcal{A} \in \mathbf{AlgSys}^*(\mathcal{I})$.

Assume, conversely, that $\mathbf{AlgSys}(\mathcal{I}) = \mathbf{AlgSys}^*(\mathcal{I})$. Since, by Proposition 1606, we have, in general, $\{ \langle \mathcal{A}, [T]^* \rangle : T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \} \subseteq \mathbf{FStr}^{\mathcal{I}}(\mathcal{A})$, it suffices to show the reverse inclusion. To this end, let $\langle \mathcal{A}, \mathcal{T} \rangle \in \mathbf{FStr}^{\mathcal{I}}(\mathcal{A})$. Then $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \in \mathbf{AlgSys}(\mathcal{I})$. By hypothesis, $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \in \mathbf{AlgSys}^*(\mathcal{I})$. Therefore, by Proposition 1615, there exists $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\mathcal{T} = [T]^*$. ■

So, one way to characterize π -institutions $\mathcal{I}$ for which $\mathcal{I}$ -algebraic systems and $\mathcal{I}^*$ -algebraic systems coincide is to look at the form of full $\mathcal{I}$ -structures. An alternative characterization uses the Leibniz and Suszko operators.

Proposition 1617 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathbf{AlgSys}(\mathcal{I}) = \mathbf{AlgSys}^*(\mathcal{I})$ if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, there exists $T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Omega^{\mathcal{A}}(T')$.*

Proof: Assume $\mathbf{AlgSys}(\mathcal{I}) = \mathbf{AlgSys}^*(\mathcal{I})$. Let $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, so that $\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \mathbf{AlgSys}(\mathcal{I})$. By Proposition 1616, there exists $T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $[T]^{\tilde{\Omega}^{\mathcal{I}}} = [T']^*$. We now get

$$\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \tilde{\Omega}^{\mathcal{A}}([T]^{\tilde{\Omega}^{\mathcal{I}}}) = \tilde{\Omega}^{\mathcal{A}}([T']^*) = \Omega^{\mathcal{A}}(T').$$

Assume, conversely, that, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, there exists $T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Omega^{\mathcal{A}}(T')$. Let $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I})$. Then, there exists $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Delta^{\mathcal{A}}$. By hypothesis, there exists $T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\Omega^{\mathcal{A}}(T') = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Delta^{\mathcal{A}}$. We conclude that $\mathcal{A} \in \mathbf{AlgSys}^*(\mathcal{I})$. The reverse inclusion always holds. Therefore, $\mathbf{AlgSys}(\mathcal{I}) = \mathbf{AlgSys}^*(\mathcal{I})$. ■

Proposition 1617, gives the following feature of protoalgebraic π -institutions.

Corollary 1618 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is protoalgebraic, then every full $\mathcal{I}$ -structure is of the form $\langle \mathcal{A}, \llbracket T \rrbracket^* \rangle$, for some $\mathbf{F}$ -algebraic system $\mathcal{A}$ and some $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

Proof: We know that, if $\mathcal{I}$ is protoalgebraic and $\mathcal{A}$ is an $\mathbf{F}$ -algebraic system, then, for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we have $\tilde{\Omega}^{\mathcal{A}, \mathcal{A}}(T) = \Omega^{\mathcal{A}}(T)$. Therefore, by Proposition 1617 and Proposition 1616, every full $\mathcal{I}$ -structure has the form claimed in the statement. ■

This property of the full $\mathcal{I}$ -structures in a more precise form, yields a characterization of protoalgebraicity.

Theorem 1619 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}$ is protoalgebraic;
- (ii) Every full $\mathcal{I}$ -structure is of the form $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle$, for some $\mathbf{F}$ -algebraic system $\mathcal{A}$ and some $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$;
- (iii) Every full $\mathcal{I}$ -structure is of the form $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle$, for some $\mathbf{F}$ -algebraic system $\mathcal{A}$ and some $T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$;
- (iv) $\llbracket T \rrbracket^* = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{T*}$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

Proof:

- (i) $\Rightarrow$ (ii) Suppose that $\mathcal{I}$ is protoalgebraic and let $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}^{\mathcal{I}}(\mathcal{A})$. By Proposition 1600, $\mathcal{T} = \{T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \leq \Omega^{\mathcal{A}}(T)\}$. By protoalgebraicity, $\mathcal{T}$ is an upset in $\text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Moreover, $\mathcal{T}$ has a least element, $T = \bigcap \mathcal{T}$. Thus, we have $\mathcal{T} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$.
- (ii) $\Rightarrow$ (iii) Assume (ii) holds and let $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}^{\mathcal{I}}(\mathcal{A})$. Then, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\mathcal{T} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. By Proposition 1608, $T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$.
- (iii) $\Rightarrow$ (iv) Assume (iii) holds and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By Proposition 1606, $\langle \mathcal{A}, \llbracket T \rrbracket^* \rangle \in \text{FStr}(\mathcal{I})$. By Proposition 1607, $T^* \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$ and, by definition $T^* = \bigcap \llbracket T \rrbracket^*$. Thus, by (iii), we get $\llbracket T \rrbracket^* = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{T*}$.
- (iv) $\Rightarrow$ (i) Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $T \leq T'$. Then, by Lemma 1605, $T^* \leq T \leq T'$. By hypothesis, $T' \in \llbracket T \rrbracket^*$. So we get, by definition of $\llbracket T \rrbracket^*$, $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. Since Ω is monotone on every $\mathbf{F}$ -algebraic system, we get that $\mathcal{I}$ is protoalgebraic. ■

21.11 Suszko Operator as an $\mathcal{I}$ -Operator

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

The $\widetilde{\Omega}^{\mathcal{I}}$ -class of T or **Suszko class of T** is

$$[[T]]^{\text{Su}} = \Omega^{\mathcal{A}^{-1}}(\widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)) = \{T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\}.$$

The **Suszko filter family of T** is

$$T^{\text{Su}} = \bigcap [[T]]^{\text{Su}}.$$

T is a **Suszko filter family** if $T^{\text{Su}} = T$. The collection of all Suszko filter families of $\mathcal{A}$ is denoted by $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$.

The following lemma gives some of the basic properties of Suszko classes and Suszko theory families.

Lemma 1620 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

- (a) $T^{\text{Su}} \leq T^* \leq T$;
- (b) $T^{\text{Su}} = T$ implies $T^* = T$;
- (c) If $T \leq T'$, then $[[T']]^{\text{Su}} \subseteq [[T]]^{\text{Su}}$ and $T^{\text{Su}} \leq T'^{\text{Su}}$;
- (d) $\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \subseteq [[T]]^{\text{Su}} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{T^{\text{Su}}}$;
- (e) $[[T]]^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$ if and only if $T^{\text{Su}} = T$.

Proof:

- (a) We have $\widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T)$. Hence $[[T]]^* \subseteq [[T]]^{\text{Su}}$. This gives

$$T^{\text{Su}} = \bigcap [[T]]^{\text{Su}} \leq [[T]]^* = T^*.$$

The last inequality is by Lemma 1605.

- (b) If $T = T^{\text{Su}}$, then, by Part (a), $T = T^*$.
- (c) If $T \leq T'$, by the monotonicity of the Suszko operator, $\widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T')$. Thus, we get $[[T']]^{\text{Su}} \subseteq [[T]]^{\text{Su}}$. Finally, $T^{\text{Su}} = \bigcap [[T]]^{\text{Su}} \leq \bigcap [[T']]^{\text{Su}} = T'^{\text{Su}}$.
- (d) Suppose $T \leq T'$. Then $\widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T') \leq \Omega^{\mathcal{A}}(T')$. So $T' \in [[T]]^{\text{Su}}$. Moreover, if $T' \in [[T]]^{\text{Su}}$, then $T^{\text{Su}} = \bigcap [[T]]^{\text{Su}} \leq T'$.

(e) By specializing Lemma 1570. ■

For the Suszko classes, we get an analogous result to Proposition 1606, to the effect that they are closure families of full $\mathcal{I}$ -structures and their Tarski congruence systems equal the Suszko congruence system of their generating theory family.

Proposition 1621 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

(a) $\langle \mathcal{A}, [T]^{\mathbf{Su}} \rangle \in \mathbf{FStr}(\mathcal{I})$;

(b) $\tilde{\Omega}^{\mathcal{A}}([T]^{\mathbf{Su}}) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$.

Proof: Part (a) is a specialization of Proposition 1563.

Since, by Lemma 1620, $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T \subseteq [T]^{\mathbf{Su}}$, we get $\tilde{\Omega}^{\mathcal{A}}([T]^{\mathbf{Su}}) \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. On the other hand, if $T' \in [T]^{\mathbf{Su}}$, then $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. Hence $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \bigcap_{T' \in [T]^{\mathbf{Su}}} \Omega^{\mathcal{A}}(T') = \tilde{\Omega}^{\mathcal{A}}([T]^{\mathbf{Su}})$. Equality now follows. ■

The mapping $T \mapsto T^{\mathbf{Su}}$ is monotone.

Lemma 1622 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system. For all $T, T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$T \leq T' \quad \text{implies} \quad T^{\mathbf{Su}} \leq T'^{\mathbf{Su}}.$$

Proof: By Proposition 1566. ■

Moreover, even though $T^{\mathbf{Su}}$ is not necessarily a Suszko theory family, in case it happens to be, it is the largest such below T .

Lemma 1623 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. For all $T' \in \mathbf{FiFam}^{\mathcal{I}, \mathbf{Su}}(\mathcal{A})$, such that $T' \leq T$, we have $T' \leq T^{\mathbf{Su}}$.*

Proof: Suppose $T' \in \mathbf{FiFam}^{\mathcal{I}, \mathbf{Su}}(\mathcal{A})$, such that $T' \leq T$. Then, by the hypothesis and Lemma 1622, $T' = T'^{\mathbf{Su}} \leq T^{\mathbf{Su}}$. ■

As far as characterizing Suszko theory families, we have the following

Proposition 1624 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. $T \in \mathbf{FiFam}^{\mathcal{I}, \mathbf{Su}}(\mathcal{A})$ if and only if $T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$ is the least $\mathcal{I}$ -filter family of $\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$.*

Proof: By Proposition 1567. ■

It turns out that the collection of Suszko theory families of a π -institution forms a join complete subsemilattice of the lattice of all theory families.

Lemma 1625 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle \in \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$ is a join complete subsemilattice of $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

Proof: Suppose $\{T^i : i \in I\} \subseteq \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. By Lemma 1622, we get, for all $i \in I$,

$$T^i = (T^i)^{\text{Su}} \leq \left(\bigvee_{i \in I} T^i \right)^{\text{Su}}.$$

This gives $\bigvee_{i \in I} T^i \leq \left(\bigvee_{i \in I} T^i \right)^{\text{Su}}$. But, by Lemma 1620, $\left(\bigvee_{i \in I} T^i \right)^{\text{Su}} \leq \bigvee_{i \in I} T^i$. Hence, we conclude that $\bigvee_{i \in I} T^i \in \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. ■

For an $\mathbf{F}$ -algebraic system $\mathcal{A}$ and $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, it turns out that T is a Suszko $\mathcal{I}$ -filter family exactly when it is the least filter family of a full $\mathcal{I}$ -structure, whose closure family consists of the upset in the lattice of $\mathcal{I}$ -theory families generated by T .

Theorem 1626 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. The following conditions are equivalent:*

- (i) $T \in \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$;
- (ii) $\langle \mathcal{A}, \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle \in \mathbf{FStr}(\mathcal{I})$;
- (iii) $T = \bigcap \mathcal{T}$, where $\mathcal{T} \subseteq \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$ is an upset and $\langle \mathcal{A}, \mathcal{T} \rangle \in \mathbf{FStr}(\mathcal{I})$.

Proof:

- (i) $\Rightarrow$ (ii) Assume that $T \in \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Then, by Lemma 1620, $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T = \llbracket T \rrbracket^{\text{Su}}$ and, moreover, by Proposition 1621, $\langle \mathcal{A}, \llbracket T \rrbracket^{\text{Su}} \rangle \in \mathbf{FStr}(\mathcal{I})$.
- (ii) $\Rightarrow$ (iii) Assume (ii) holds and set $\mathcal{T} = \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. Then, $T = \bigcap \mathcal{T}$, $\mathcal{T}$ is an upset in $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$ and, by hypothesis, $\langle \mathcal{A}, \mathcal{T} \rangle \in \mathbf{FStr}(\mathcal{I})$.
- (iii) $\Rightarrow$ (i) Suppose, finally, that $T = \bigcap \mathcal{T}$, where $\mathcal{T}$ is an upset in $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$ and $\langle \mathcal{A}, \mathcal{T} \rangle$ is a full $\mathcal{I}$ -structure. We then have $T = \bigcap \mathcal{T} \in \mathcal{T}$, since $\mathcal{T}$ is a closure family. Hence, since $\mathcal{T}$ is an upset, $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T \subseteq \mathcal{T}$. But, by hypothesis $T = \bigcap \mathcal{T}$, whence $\mathcal{T} \subseteq \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. Thus, we get that $\mathcal{T} = \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. Since $\langle \mathcal{A}, \mathcal{T} \rangle$ is a full $\mathcal{I}$ -structure, we have, by Theorem 1432,

$$\mathcal{T} = \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T = \{T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T) \leq \Omega^{\mathcal{A}}(T')\}.$$

But $\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$, whence $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T = \llbracket T \rrbracket^{\text{Su}}$. Now we get $T = \bigcap \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T = \bigcap \llbracket T \rrbracket^{\text{Su}} = T^{\text{Su}}$ and $T \in \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$.

■

It turns out that requiring that all $\mathcal{I}$ -filter families on all $\mathbf{F}$ -algebraic systems be Suszko filter families is tantamount to $\mathcal{I}$ being family completely reflective.

Theorem 1627 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}$ is family c-reflective;
- (ii) For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$;
- (iii) For every $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

Proof:

- (i) $\Rightarrow$ (iii) Assume that $\mathcal{I}$ is family c-reflective and let $\mathcal{A}$ be an $\mathcal{I}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, for all $T' \in \llbracket T \rrbracket^{\text{Su}}$, we have $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. By family c-reflectivity and Lemma 827, we get $T \leq T'$. Thus, $T \leq \bigcap \llbracket T \rrbracket^{\text{Su}} = T^{\text{Su}}$. Since, by Lemma 1620, $T^{\text{Su}} \leq T$, we get $T = T^{\text{Su}}$, i.e., $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. We conclude that $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.
- (iii) $\Rightarrow$ (ii) Suppose that (iii) holds and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T).$$

Set $T' \in \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))$. Since $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$ is compatible with T , by Corollary 57, $T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))$. Thus, by definition, $T' \leq T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. Thus, we get

$$\tilde{\Omega}^{\mathcal{I}, \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}(T') \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}.$$

By hypothesis, since $\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \text{AlgSys}(\mathcal{I})$, we get that

$$T', T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)).$$

By Proposition 1565, $T' = T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. Thus, $T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$ is the least $\mathcal{I}$ -theory family on $\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. Therefore, by Proposition 1624, $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$.

- (ii) $\Rightarrow$ (i) Assume (ii) and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. By definition, $T' \in \llbracket T \rrbracket^{\text{Su}}$. Since $T = T^{\text{Su}}$, we get that $T = \bigcap \llbracket T \rrbracket^{\text{Su}} \leq T'$. By Lemma 827, $\mathcal{I}$ is family c-reflective. ■

Using Theorem 1627, we get additional characterizations of family c-reflectivity.

Corollary 1628 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}$ is family c-reflective;
- (ii) $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle \in \text{FStr}(\mathcal{I})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$;
- (iii) $\llbracket T \rrbracket^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

Proof:

- (i) $\Rightarrow$ (ii) Assume $\mathcal{I}$ is family c-reflective and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By Theorem 1627, $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Thus, by Theorem 1626, $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle \in \text{FStr}(\mathcal{I})$.
- (ii) $\Rightarrow$ (iii) Assume (ii). Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By hypothesis, $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle \in \text{FStr}(\mathcal{I})$. Thus, by Theorem 1626, $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Therefore, by Lemma 1620, $\llbracket T \rrbracket^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$.
- (iii) $\Rightarrow$ (i) Assume (iii). Then, by Lemma 1620, $\text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Therefore, by Theorem 1627, $\mathcal{I}$ is family c-reflective. ■

The condition that all full $\mathcal{I}$ -structures are of the form given in Part (ii) of Theorem 1628 is tantamount to weak family algebraizability.

Corollary 1629 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is weakly family algebraizable if and only if $\text{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle : T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$.*

Proof: By definition $\mathcal{I}$ is WF algebraizable if and only if it is protoalgebraic and family c-reflective, if and only if, by Theorem 1619 and by Corollary 1628, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FStr}^{\mathcal{I}}(\mathcal{A}) \subseteq \{ \langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle : T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}$ and $\{ \langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle : T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \} \subseteq \text{FStr}^{\mathcal{I}}(\mathcal{A})$, if and only if $\text{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle : T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$. ■

Moreover, as far as characterizations of WF algebraizability we obtain one that involves both Suszko classes and Suszko filter families.

Proposition 1630 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is weakly family algebraizable if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$ and, for every $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\mathcal{T} = \llbracket T \rrbracket^{\text{Su}}$.*

Proof: Suppose that $\mathcal{I}$ is weakly family algebraizable. Since it is protoalgebraic, by Theorem 1619, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, if $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$, then $\mathcal{T} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$, for some $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Since $\mathcal{I}$ is family c-reflective, by Corollary 1628, $\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T = \llbracket T \rrbracket^{\text{Su}}$. Hence, if $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$, then $\mathcal{T} = \llbracket T \rrbracket^{\text{Su}}$, for some $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Finally, by Theorem 1627, $\text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$.

Suppose, conversely, that the given property holds. Since, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, by Theorem 1627, $\mathcal{I}$ is family c-reflective. By, Corollary 1628, for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\llbracket T \rrbracket^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. By hypothesis, for all $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\mathcal{T} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. Hence, by Theorem 1619, $\mathcal{I}$ is also protoalgebraic. We conclude that $\mathcal{I}$ is WF algebraizable. ■

As far as Suszko classes go, we have a special correspondence theorem that follows from the General Correspondence Theorem 1589 for O -classes.

Theorem 1631 (Correspondence Theorem for Suszko Classes) *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. If $\langle H, \gamma \rangle$ is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T , then γ induces an order isomorphism from $\llbracket T \rrbracket^{\text{Su}}$ to $\llbracket \gamma(T) \rrbracket^{\text{Su}}$, with inverse γ^{-1} .*

Proof: By Proposition 1581, $\tilde{\Omega}^{\mathcal{I}}$ is a semi-coherent family of compatibility $\mathcal{I}$ -operators, whence, by Theorem 1589, we get the conclusion. ■

Under the hypotheses of Theorem 1631, we also obtain a correspondence between Suszko filter families:

Corollary 1632 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\langle H, \gamma \rangle$ is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T . Then*

$$T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \quad \text{iff} \quad \gamma(T) \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{B}).$$

Proof: We have

$$\begin{aligned} T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) & \text{ iff } T = T^{\text{Su}} \\ & \text{ iff } T = \bigcap \llbracket T \rrbracket^{\text{Su}} \\ & \text{ iff } \gamma(T) = \bigcap \llbracket \gamma(T) \rrbracket^{\text{Su}} \quad (\text{by Theorem 1631}) \\ & \text{ iff } \gamma(T) = \gamma(T)^{\text{Su}} \\ & \text{ iff } \gamma(T) \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{B}). \end{aligned}$$

■

Analogously to Theorem 1614, characterizing protoalgebraicity via a correspondence between posets of filter families of $\mathcal{F}$ -algebraic systems related via surjective strict morphisms, we get a correspondence theorem characterizing family c-reflectivity.

Theorem 1633 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is family c-reflective if and only if, for all $\mathbf{F}$ -algebraic systems $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$, all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$, and all strict surjective $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$, with H an isomorphism, such that $\langle H, \gamma \rangle$ is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T , γ induces an order isomorphism from $\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$ onto $\text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'^{\text{Su}}}$, with inverse γ^{-1} .*

Proof: Suppose, first, that $\mathcal{I}$ is family c-reflective. Let $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$ be a strict surjective morphism, with H an isomorphism, such that $\langle H, \gamma \rangle$ is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T . By Theorem 1631, $\gamma : [T]^{\text{Su}} \rightarrow [T']^{\text{Su}}$ is an order isomorphism with inverse γ^{-1} . By Corollary 1628, $[T]^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A}^T)$ and $[T']^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{B}^{T'})$. Moreover, by Theorem 1627, $T' = T'^{\text{Su}}$. Thus, we get the conclusion.

Assume, conversely, that the given condition holds. It suffices, by Theorem 1627, to show that every $\mathcal{I}$ -filter family on every $\mathbf{F}$ -algebraic system is a Suszko $\mathcal{I}$ -filter family. So let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T).$$

Then $\langle I, \pi \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T), T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \rangle$ is a strict surjective morphism, with I an isomorphism and it is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T . By hypothesis,

$$\pi : \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rightarrow \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))^{(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))^{\text{Su}}}$$

is an order isomorphism with inverse π^{-1} .

- By Lemma 1594, we get $\tilde{\Omega}^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}$. Thus, by the definition of a Suszko class,

$$[T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)]^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)),$$

whence $(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))^{\text{Su}} = \cap \text{FiFam}^{\mathcal{I}}(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))$ and, therefore,

$$\text{FiFam}^{\mathcal{I}}(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))^{(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))^{\text{Su}}} = \text{FiFam}^{\mathcal{I}}(T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)).$$

- By Theorem 1631, $\pi : [T]^{\text{Su}} \rightarrow [T/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)]^{\text{Su}}$ is an order isomorphism with inverse π^{-1} .

We conclude that $\llbracket T \rrbracket^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. By Lemma 1620, $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Thus, every $\mathcal{I}$ -filter family on every $\mathbf{F}$ -algebraic system is a Suszko $\mathcal{I}$ -filter family and, by Theorem 1627, $\mathcal{I}$ is family c-reflective. ■

Along similar lines, for weakly family algebraizable π -institutions, we get the following characterization, which consists of strengthening the condition in Theorem 1633 by requiring that it holds for all strict surjective morphisms with isomorphic signature components, without additional compatibility requirements.

Theorem 1634 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is weakly family algebraizable if and only if, for all $\mathbf{F}$ -algebraic systems $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$, all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$, and all strict surjective morphisms $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$, with H an isomorphism, γ induces an order isomorphism from $\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$ onto $\text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'^{\text{Su}}}$, with inverse γ^{-1} .*

Proof: Suppose, first, that $\mathcal{I}$ is weakly family algebraizable. On the one hand, it is protoalgebraic, whence, by Theorem 1614, $\gamma : \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rightarrow \text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$ is an order isomorphism with inverse γ^{-1} . On the other hand, it is family c-reflective, whence by Theorem 1627, $T' = T'^{\text{Su}}$. This establishes the conclusion.

Assume, conversely, that the property in the statement holds. Then, by Theorem 1633, $\mathcal{I}$ is family c-reflective. Thus, by Theorem 1627, $T'^{\text{Su}} = T'$. So $\gamma : \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rightarrow \text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$ is an order isomorphism with inverse γ^{-1} . Hence, by Theorem 1614, $\mathcal{I}$ is also protoalgebraic. Therefore, $\mathcal{I}$, being both protoalgebraic and family c-reflective, is weakly family algebraizable. ■

Next, in analogy with Proposition 1616, we give a characterization of those π -institutions $\mathcal{I}$ all of whose $\mathcal{I}$ -structures correspond to closure families consisting of Suszko classes.

Proposition 1635 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\text{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, \llbracket T \rrbracket^{\text{Su}} \rangle : T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$;
- (ii) $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is surjective, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$.

Proof:

- (i) $\Rightarrow$ (ii) Suppose (i) holds. Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $\theta \in \text{ConSys}^{\mathcal{I}}(\mathcal{A})$. Then, by Corollary 1602, there exists $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathcal{T} \rangle \in$

$\text{FStr}^{\mathcal{I}}(\mathcal{A})$ and $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \theta$. By hypothesis, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\mathcal{T} = \llbracket T \rrbracket^{\text{Su}}$. Now we get, using Proposition 1621,

$$\theta = \tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \tilde{\Omega}^{\mathcal{A}}(\llbracket T \rrbracket^{\text{Su}}) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T).$$

Thus, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is indeed surjective.

- (ii) $\Rightarrow$ (i) Assume that (ii) holds. Since, by Proposition 1621, the right-to-left inclusion in (i) always holds, it suffices to show the reverse inclusion. To this end, let $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$. Then $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \in \text{AlgSys}(\mathcal{I})$, which gives that $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \in \text{ConSys}^{\mathcal{A}}(\mathcal{A})$. Therefore, by hypothesis, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. Since, by Proposition 1621, $\tilde{\Omega}^{\mathcal{A}}(\llbracket T \rrbracket^{\text{Su}}) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$ and, by Proposition 1621, $\langle \mathcal{A}, \llbracket T \rrbracket^{\text{Su}} \rangle \in \text{FStr}^{\mathcal{I}}(\mathcal{A})$, we get, by the isomorphism established in Corollary 1602, that $\mathcal{T} = \llbracket T \rrbracket^{\text{Su}}$. ■

The next proposition provides a characterization of weakly family algebraizable π -institution inside the class of family c-reflective ones, based on the form of their full $\mathcal{I}$ -structures.

Proposition 1636 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family c-reflective π -institution based on $\mathbf{F}$. $\mathcal{I}$ is weakly family algebraizable if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$,*

$$\text{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, \llbracket T \rrbracket^{\text{Su}} \rangle : T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}.$$

Proof: Suppose, first, that $\mathcal{I}$ is weakly family algebraizable. Since this implies that $\mathcal{I}$ is protoalgebraic, we get that $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$. Thus, by Proposition 1616, $\text{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, \llbracket T \rrbracket^{\text{Su}} \rangle : T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$.

Suppose, conversely, that the condition given in the statement holds and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Since $\Omega^{\mathcal{A}}(T) \in \text{ConSys}^{\mathcal{I}*}(\mathcal{A}) \subseteq \text{ConSys}^{\mathcal{I}}(\mathcal{A})$, by hypothesis and Proposition 1635, there exists $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\Omega^{\mathcal{A}}(T) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T')$. Hence, $\llbracket T \rrbracket^* = \llbracket T' \rrbracket^{\text{Su}}$. Since $\mathcal{I}$ is family c-reflective, by Theorem 1627 and Lemma 1620, $\text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$. Thus, $T = T^* = T'^{\text{Su}} = T'$. We conclude that $\Omega^{\mathcal{A}}(T) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. By Proposition 1604, we conclude that $\mathcal{I}$ is protoalgebraic. Since, by hypothesis, it is family c-reflective, we conclude that $\mathcal{I}$ is weakly family algebraizable. ■

We see, next, that family c-reflectivity is characterized by the property that all principal filters in the lattice of filter families are Suszko full classes and, also, by the reflectivity of the Suszko operator on every $\mathbf{F}$ -algebraic system.

Proposition 1637 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}$ is family c-reflective;
- (ii) $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T$ is Suszko full for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$;
- (iii) $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \mathbf{ConSys}(\mathcal{A})$ is order reflecting, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$.

Proof:

- (i) $\Rightarrow$ (iii) Suppose that $\mathcal{I}$ is family c-reflective and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T, T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T')$. Then we get

$$\bigcap \{ \Omega^{\mathcal{A}}(T'') : T \leq T'' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \} \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T') \leq \Omega^{\mathcal{A}}(T').$$

By hypothesis and Lemma 827, $\bigcap \{ T'' : T \leq T'' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \} \leq T'$, i.e., $T \leq T'$. Thus, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is order reflecting.

- (iii) $\Rightarrow$ (i) If $\tilde{\Omega}^{\mathcal{I}}$ is order reflecting, then it is a fortiori injective. Thus, by Theorem 828, $\mathcal{I}$ is family c-reflective.
- (ii) $\Rightarrow$ (iii) Assume (ii) holds. Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T, T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T')$. Then, by hypothesis,

$$\begin{aligned} \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T &= \tilde{\Omega}^{\mathcal{I}, \mathcal{A}^{-1}}(\widetilde{\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T)}) \\ &= \tilde{\Omega}^{\mathcal{I}, \mathcal{A}^{-1}}(\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)) \\ &= \{ T'' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T'') \}. \end{aligned}$$

Similarly, $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^{T'} = \{ T'' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T') \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T'') \}$. Therefore, $T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T$, i.e., $T \leq T'$ and $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is order reflecting.

- (iii) $\Rightarrow$ (ii) Assume $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is order reflecting for every $\mathbf{F}$ -algebraic system $\mathcal{A}$. Then

$$\begin{aligned} \tilde{\Omega}^{\mathcal{I}, \mathcal{A}^{-1}}(\widetilde{\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T)}) &= \tilde{\Omega}^{\mathcal{I}, \mathcal{A}^{-1}}(\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)) \\ &= \{ T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T') \} \\ &= \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T. \end{aligned}$$

Hence $\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T$ is Suszko full. ■

Finally, we conclude the section with a characterization of protoalgebraicity in terms of the form of full $\mathcal{I}$ -structures and, also, by the coincidence of Leibniz and Suszko classes.

Proposition 1638 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}$ is protoalgebraic;
- (ii) $\mathbf{FStr}(\mathcal{I}) = \{ \langle \mathcal{A}, \mathbf{FiFam}^{\mathcal{I}, \tilde{\Omega}^{\mathcal{I}}}(\mathcal{A}) \rangle : \mathcal{A} \in \mathbf{AlgSys}(\mathbf{F}) \}$;
- (iii) $\llbracket T \rrbracket^* = \llbracket T \rrbracket^{\mathbf{Su}}$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$.

Proof:

(i) $\Rightarrow$ (ii) Suppose $\mathcal{I}$ is protoalgebraic. Then, by Theorem 1619,

$$\mathbf{FStr}(\mathcal{I}) = \{ \langle \mathcal{A}, \mathbf{FiFam}^{\mathcal{I}, \Omega}(\mathcal{A}) \rangle : \mathcal{A} \in \mathbf{AlgSys}(\mathbf{F}) \}.$$

But, by Lemma 1555, $\tilde{\Omega}^{\mathcal{I}} = \Omega$, whence, the conclusion follows.

(i) $\Rightarrow$ (iii) If $\mathcal{I}$ is protoalgebraic, then, by Lemma 1555, $\tilde{\Omega}^{\mathcal{I}} = \Omega$. Therefore, $\llbracket T \rrbracket^* = \llbracket T \rrbracket^{\mathbf{Su}}$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$.

(ii) $\Rightarrow$ (i) Suppose (ii) holds. Then, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$,

$$\mathbf{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle : T \in \mathbf{FiFam}^{\mathcal{I}, \tilde{\Omega}^{\mathcal{I}}}(\mathcal{A}) \}.$$

So by Theorem 1619, $\mathcal{I}$ is protoalgebraic.

(iii) $\Rightarrow$ (i) Assume (iii). Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T, T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $T \leq T'$. By Lemma 1620,

$$T' \in \llbracket T' \rrbracket^{\mathbf{Su}} \subseteq \llbracket T \rrbracket^{\mathbf{Su}} = \llbracket T \rrbracket^*.$$

So $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. Thus, Ω is monotone and, therefore, $\mathcal{I}$ is protoalgebraic. ■

21.12 Frege Operator as an $\mathcal{I}$ -Operator

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$ and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system.

Recall that $\lambda^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \mathbf{EqvFam}(\mathcal{A})$ is given, for all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, by setting $\lambda^{\mathcal{A}}(T) = \{ \lambda_{\Sigma}^{\mathcal{A}}(T) \}_{\Sigma \in |\mathbf{Sign}|}$, where, for all $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi \in \mathbf{SEN}(\Sigma)$,

$$\lambda_{\Sigma}^{\mathcal{A}}(T) = \{ \langle \phi, \psi \rangle \in \mathbf{SEN}(\Sigma)^2 : \phi \in T_{\Sigma} \text{ iff } \psi \in T_{\Sigma} \}.$$

Its lifting is the operator $\tilde{\lambda}^{\mathcal{A}} : \mathcal{P}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})) \rightarrow \mathbf{EqvFam}(\mathcal{A})$, given, for all $\mathcal{T} \subseteq \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$,

$$\tilde{\lambda}^{\mathcal{A}}(\mathcal{T}) = \bigcap \{ \lambda^{\mathcal{A}}(T') : T' \in \mathcal{T} \}.$$

Its relativization is the operator $\tilde{\lambda}^{\mathcal{I},\mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{EqvFam}(\mathcal{A})$, given, for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, by

$$\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) = \bigcap \{ \lambda^{\mathcal{A}}(T') : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}.$$

Given $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, the $\tilde{\lambda}^{\mathcal{I}}$ -**class** of T or **Frege class** of T is

$$[T]^{\tilde{\lambda}^{\mathcal{I}}} = \Omega^{\mathcal{A}^{-1}}(\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T)) = \{ T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T') \}.$$

Since λ is not a compatibility $\mathcal{I}$ -operator, $[T]^{\tilde{\lambda}^{\mathcal{I}}}$ may not be the closure family of a full $\mathcal{I}$ -structure. But, nevertheless, it is still a closure family on $\text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

Proposition 1639 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then $[T]^{\tilde{\lambda}^{\mathcal{I}}}$ is a closure family on $\text{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

Proof: This is specialization of Proposition 1562. ■

Given $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, based on Proposition 1639, we denote by $T^{\tilde{\lambda}^{\mathcal{I}}}$ the least $\mathcal{I}$ -filter family of $[T]^{\tilde{\lambda}^{\mathcal{I}}}$, i.e.,

$$T^{\tilde{\lambda}^{\mathcal{I}}} = \bigcap [T]^{\tilde{\lambda}^{\mathcal{I}}}.$$

Moreover, we say that T is a **Frege filter family** if $T = T^{\tilde{\lambda}^{\mathcal{I}}}$. The collection of all Frege $\mathcal{I}$ -filter families of $\mathcal{A}$ is denoted by $\text{FiFam}^{\mathcal{I},\tilde{\lambda}^{\mathcal{I}}}(\mathcal{A})$.

We give, now, a characterization of Frege filter families for π -institutions with theorems.

Lemma 1640 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$, having theorems, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

$$T \in \text{FiFam}^{\mathcal{I},\tilde{\lambda}^{\mathcal{I}}}(\mathcal{A}) \quad \text{iff} \quad \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T) \quad \text{iff} \quad T \in [T]^{\tilde{\lambda}^{\mathcal{I}}}.$$

Proof: The last equivalence is by the definition of $[T]^{\tilde{\lambda}^{\mathcal{I}}}$. So it suffices to show the first equivalence.

Suppose, first, that $T \in \text{FiFam}^{\mathcal{I},\tilde{\lambda}^{\mathcal{I}}}(\mathcal{A})$. Then, we have

$$\begin{aligned} T &= T^{\tilde{\lambda}^{\mathcal{I}}} \\ &= \bigcap [T]^{\tilde{\lambda}^{\mathcal{I}}} \\ &= \bigcap \{ T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T') \}. \end{aligned}$$

Thus, taking into account Proposition 1639, $\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T)$.

Suppose, conversely, that $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T)$. Let $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $T' \in \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$, i.e., $\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. Let $\Sigma \in |\mathbf{Sign}|$ and $t \in C_{\Sigma}^{\mathcal{I},\mathcal{A}}(\emptyset)$, which exists, since $\mathcal{I}$ is assumed to have theorems. Then, if $\phi \in \text{SEN}(\Sigma)$, such that $\phi \in T_{\Sigma}$, we get $C_{\Sigma}^{\mathcal{I},\mathcal{A}}(T_{\Sigma}, \phi) = T_{\Sigma} = C_{\Sigma}^{\mathcal{I},\mathcal{A}}(T_{\Sigma}, t)$. Thus, $\langle \phi, t \rangle \in \tilde{\lambda}_{\Sigma}^{\mathcal{I},\mathcal{A}}(T) \subseteq \Omega_{\Sigma}^{\mathcal{A}}(T')$. Since $t \in T'_{\Sigma}$, by compatibility, $\phi \in T'_{\Sigma}$. Therefore, $T \leq T'$. Now we have

$$\begin{aligned} T &\leq \bigcap \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}} \quad (T \leq T', \text{ for all } T' \in \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}) \\ &= T^{\tilde{\lambda}^{\mathcal{I}}} \quad (\text{by definition}) \\ &\leq T. \quad (\text{since } T \in \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}) \end{aligned}$$

Hence, we conclude that $T = T^{\tilde{\lambda}^{\mathcal{I}}}$ and $T \in \text{FiFam}^{\mathcal{I},\tilde{\lambda}^{\mathcal{I}}}(\mathcal{A})$. $\blacksquare$

Assuming that the π -institution $\mathcal{I}$ is protoalgebraic, gives the following characterization of Frege filter families.

Corollary 1641 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a protoalgebraic π -institution based on $\mathbf{F}$, having theorems, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.*

$$T \in \text{FiFam}^{\mathcal{I},\tilde{\lambda}^{\mathcal{I}}}(\mathcal{A}) \quad \text{iff} \quad \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T).$$

Proof: If $T \in \text{FiFam}^{\mathcal{I},\tilde{\lambda}^{\mathcal{I}}}(\mathcal{A})$, then

$$\begin{aligned} \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) &\leq \Omega^{\mathcal{A}}(T) \quad (\text{by Lemma 1640}) \\ &= \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) \quad (\text{by protoalgebraicity}) \\ &\leq \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T). \quad (\text{by compatibility}) \end{aligned}$$

Thus, $\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) = \Omega^{\mathcal{A}}(T)$. The converse is by Lemma 1640. $\blacksquare$

Each component of any $\mathcal{I}$ -filter family is determined by any of its elements modulo the Frege operator.

Proposition 1642 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$, having theorems, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in T_{\Sigma}$, $T_{\Sigma} = \phi / \tilde{\lambda}_{\Sigma}^{\mathcal{I},\mathcal{A}}(T)$.*

Proof: Suppose that $T \in \text{FiFam}^{\mathcal{I},\tilde{\lambda}^{\mathcal{I}}}(\mathcal{A})$ and let $\Sigma \in |\mathbf{Sign}|$, $\phi \in T_{\Sigma}$.

- Let $\psi \in T_{\Sigma}$. Then, we have $C_{\Sigma}^{\mathcal{I},\mathcal{A}}(T_{\Sigma}, \phi) = T_{\Sigma} = C_{\Sigma}^{\mathcal{I},\mathcal{A}}(T_{\Sigma}, \psi)$. Thus, $\langle \phi, \psi \rangle \in \tilde{\lambda}_{\Sigma}^{\mathcal{I},\mathcal{A}}(T)$, i.e., $\psi \in \phi / \tilde{\lambda}_{\Sigma}^{\mathcal{I},\mathcal{A}}(T)$.
- Conversely, if $\psi \in \phi / \tilde{\lambda}_{\Sigma}^{\mathcal{I},\mathcal{A}}(T)$, then $\langle \phi, \psi \rangle \in \tilde{\lambda}_{\Sigma}^{\mathcal{I},\mathcal{A}}(T)$, which gives $C_{\Sigma}^{\mathcal{I},\mathcal{A}}(T_{\Sigma}, \phi) = C_{\Sigma}^{\mathcal{I},\mathcal{A}}(T_{\Sigma}, \psi)$. Since $\phi \in T_{\Sigma}$, we get $\psi \in T_{\Sigma}$.

We conclude that $T_\Sigma = \phi / \tilde{\lambda}_\Sigma^{\mathcal{I}, \mathcal{A}}(T)$. ■

Every Frege filter family is also a Leibniz filter family.

Lemma 1643 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$, having theorems. Then*

$$\text{FiFam}^{\mathcal{I}, \tilde{\lambda}^{\mathcal{I}}}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}).$$

Proof: Suppose $T \in \text{FiFam}^{\mathcal{I}, \tilde{\lambda}^{\mathcal{I}}}(\mathcal{A})$. Then, by Lemma 1640, $\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T)$. Since $T^* \in \llbracket T \rrbracket^*$, we also have $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^*)$. Therefore, $\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^*)$. Thus, by definition, $T^* \in \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$. Now we have

$$T = T^{\lambda^{\mathcal{I}}} = \bigcap \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}} \leq T^*$$

and, since, by Lemma 1605, $T^* \leq T$ always holds, we get $T = T^*$, i.e., $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. ■

We saw that, in general, the Leibniz and Suszko filter families of a given filter family T are included in T , i.e., $T^*, T^{\text{Su}} \leq T$. On the other hand, for Frege filter families, we have the reverse inclusion.

Lemma 1644 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$, having theorems, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system. For all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T \leq T^{\tilde{\lambda}^{\mathcal{I}}}$.*

Proof: By Proposition 1639, $T^{\lambda^{\mathcal{I}}} \in \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$. Thus, $\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^{\lambda^{\mathcal{I}}})$. Let $\Sigma \in |\mathbf{Sign}|$ and $t \in C_\Sigma^{\mathcal{I}, \mathcal{A}}(\emptyset)$ and assume $\phi \in T_\Sigma$. Then, we have $C_\Sigma^{\mathcal{I}, \mathcal{A}}(T_\Sigma, t) = T_\Sigma = C_\Sigma^{\mathcal{I}, \mathcal{A}}(T_\Sigma, \phi)$, i.e., $\langle t, \phi \rangle \in \tilde{\lambda}_\Sigma^{\mathcal{I}, \mathcal{A}}(T)$. By the preceding inequality, $\langle t, \phi \rangle \in \Omega_\Sigma^{\mathcal{A}}(T^{\tilde{\lambda}^{\mathcal{I}}})$. But $t \in T_\Sigma^{\tilde{\lambda}^{\mathcal{I}}}$, whence, by compatibility, $\phi \in T_\Sigma^{\lambda^{\mathcal{I}}}$. We conclude that $T \leq T^{\tilde{\lambda}^{\mathcal{I}}}$. ■

Strong Fregeanity is characterized by compatibility of the Frege operator on theory families and, similarly, full strong Fregeanity by the compatibility of the Frege operator on filter families of arbitrary algebraic systems.

Proposition 1645 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$.*

- (a) $\mathcal{I}$ is strongly Fregean if and only if $\tilde{\lambda}^{\mathcal{I}, \mathcal{F}}$ is a compatibility $\mathcal{I}$ -operator on $\mathcal{F}$;
- (b) $\mathcal{I}$ is fully strongly Fregean if and only if $\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}$ is a compatibility $\mathcal{I}$ -operator on every $\mathbf{F}$ -algebraic system $\mathcal{A}$.

Proof: We only prove Part (a) in detail. Part (b) may be proved similarly, by working on an arbitrary $\mathbf{F}$ -algebraic system $\mathcal{A}$ instead of on $\mathcal{F}$.

Suppose $\mathcal{I}$ is strongly Fregean. Then, by definition, for all $T \in \text{ThFam}(\mathcal{I})$, $\tilde{\lambda}^{\mathcal{I},\mathcal{F}}(T) \leq \tilde{\Omega}^{\mathcal{I},\mathcal{F}}(T) \leq \Omega^{\mathcal{F}}(T)$. So $\lambda^{\mathcal{I},\mathcal{F}}$ is a compatibility $\mathcal{I}$ -operator on $\mathcal{F}$.

Suppose, conversely, that $\tilde{\lambda}^{\mathcal{I},\mathcal{F}}$ is a compatibility $\mathcal{I}$ -operator on $\mathcal{F}$. Then, for all $T \in \text{ThFam}(\mathcal{I})$, $\tilde{\lambda}^{\mathcal{I},\mathcal{F}}(T) \leq \Omega^{\mathcal{F}}(T)$. Therefore,

$$\begin{aligned} \tilde{\lambda}^{\mathcal{I},\mathcal{F}}(T) &= \bigcap \{ \tilde{\lambda}^{\mathcal{I},\mathcal{F}}(T') : T \leq T' \in \text{ThFam}(\mathcal{I}) \} \quad (\text{monotonicity of } \tilde{\lambda}^{\mathcal{I},\mathcal{F}}) \\ &\leq \bigcap \{ \Omega^{\mathcal{F}}(T') : T \leq T' \in \text{ThFam}(\mathcal{I}) \} \quad (\text{by the hypothesis}) \\ &= \tilde{\Omega}^{\mathcal{I},\mathcal{F}}(T). \quad (\text{by definition}) \end{aligned}$$

Since, by compatibility, $\tilde{\Omega}^{\mathcal{I},\mathcal{F}}(T) \leq \tilde{\lambda}^{\mathcal{I},\mathcal{F}}(T)$ always holds, we conclude that $\mathcal{I}$ is strongly Fregean. ■

The characterizations of Proposition 1645 imply that a π -institution if strongly Fregean if and only if every theory family is Frege and that it is fully strongly Fregean if and only if every filter family of any algebraic system is a Frege filter family.

Corollary 1646 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C' \rangle$ be a π -institution based on $\mathbf{F}$, having theorems. $\mathcal{I}$ is strongly Fregean if and only if $\text{ThFam}(\mathcal{I}) = \text{ThFam}^{\tilde{\lambda}^{\mathcal{I}}}(\mathcal{I})$.*

Proof: Suppose $\mathcal{I}$ is strongly Fregean and let $T \in \text{ThFam}(\mathcal{I})$. By Proposition 1645, $\tilde{\lambda}^{\mathcal{I},\mathcal{F}}(T) \leq \Omega^{\mathcal{F}}(T)$. Thus, by Lemma 1640, $T \in \text{ThFam}^{\tilde{\lambda}^{\mathcal{I}}}(\mathcal{I})$.

Assume, conversely, that every theory family of $\mathcal{I}$ is Frege. Then, by Lemma 1640, for all $T \in \text{ThFam}(\mathcal{I})$, $\tilde{\lambda}^{\mathcal{I},\mathcal{F}}(T) \leq \Omega^{\mathcal{F}}(T)$. Thus, by Proposition 1645, $\mathcal{I}$ is strongly Fregean. ■

Corollary 1647 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C' \rangle$ be a π -institution based on $\mathbf{F}$, having theorems. $\mathcal{I}$ is fully strongly Fregean if and only if $\text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I},\tilde{\lambda}^{\mathcal{I}}}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$.*

Proof: The proof follows along the same lines as that of Corollary 1646, using Proposition 1645 and Lemma 1640, but applied over an arbitrary $\mathbf{F}$ -algebraic system $\mathcal{A}$ instead of over $\mathcal{F}$. ■

Our next goal is to show that the Frege operator $\tilde{\lambda}^{\mathcal{I}}$ is a semi-coherent family of $\mathcal{I}$ -operators. But, first, we need to have available an isomorphism theorem involving this operator. So we embark on some preparatory work.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C' \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ $\mathbf{F}$ -algebraic systems, and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$. A surjective morphism $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$ is called **deductive** if, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$,

$$\gamma_{\Sigma}(\phi) = \gamma_{\Sigma}(\psi) \quad \text{implies} \quad C_{\Sigma}^{\mathcal{I},\mathcal{A}}(T_{\Sigma}, \phi) = C_{\Sigma}^{\mathcal{I},\mathcal{A}}(T_{\Sigma}, \psi).$$

Equivalently, $\langle H, \gamma \rangle$ is deductive if and only if

$$\text{Ker}(\langle H, \gamma \rangle) \leq \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T),$$

i.e., if and only if $\langle H, \gamma \rangle$ is $\tilde{\lambda}^{\mathcal{I}}$ -compatible with T .

We now show that for a surjective morphism, with an isomorphic signature component, compatibility properties and deductive morphisms are very closely interrelated.

Lemma 1648 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ $\mathbf{F}$ -algebraic systems, and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. For a surjective morphism $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$, with H an isomorphism, the following statements are equivalent:*

- (i) $\langle H, \gamma \rangle$ is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T ;
- (ii) $\langle H, \gamma \rangle$ is $\tilde{\lambda}^{\mathcal{I}}$ -compatible with T ;
- (iii) $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, \gamma(T) \rangle$ is deductive.

Proof:

- (i) $\Rightarrow$ (ii) Suppose $\text{Ker}(\langle H, \gamma \rangle) \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. Since, by compatibility, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)$, we get that $\text{Ker}(\langle H, \gamma \rangle) \leq \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)$. Thus $\langle H, \gamma \rangle$ is $\tilde{\lambda}^{\mathcal{I}}$ -compatible with T .
- (ii) $\Rightarrow$ (iii) Suppose $\text{Ker}(\langle H, \gamma \rangle) \leq \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)$. This implies that $\text{Ker}(\langle H, \gamma \rangle)$ is compatible with T . Indeed, if $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\gamma_{\Sigma}(\phi) = \gamma_{\Sigma}(\psi)$ and $\phi \in T_{\Sigma}$, then, by the hypothesis, $\langle \phi, \psi \rangle \in \tilde{\lambda}_{\Sigma}^{\mathcal{I}, \mathcal{A}}(T)$, i.e., $C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(T_{\Sigma}, \phi) = C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(T_{\Sigma}, \psi)$. Since $\phi \in T_{\Sigma}$, we get that $\psi \in T_{\Sigma}$. Thus, by Corollary 56, $\gamma(T) \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$. Moreover, by hypothesis and the comments preceding the lemma, $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, \gamma(T) \rangle$ is a deductive morphism.
- (iii) $\Rightarrow$ (i) Suppose that $\text{Ker}(\langle H, \gamma \rangle) \leq \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)$. Then, since, by Corollary 17, $\text{Ker}(\langle H, \gamma \rangle)$ is a congruence system on $\mathcal{A}$ and, by Proposition 1457, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$ is the largest congruence system on $\mathcal{A}$ included in $\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)$, we conclude that $\text{Ker}(\langle H, \gamma \rangle) \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. Thus, $\langle H, \gamma \rangle$ is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T . ■

We now show that each deductive morphism, with an isomorphic signature component, induces an order isomorphism between the principal filter of the lattice of filter families generated by the domain and the principal filter of the lattice of theory families generate by its codomain.

Theorem 1649 (Correspondence Theorem for Deductive Morphisms)

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ $\mathbf{F}$ -algebraic systems, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$ a deductive morphism, with H an isomorphism. Then γ induces an order isomorphism from $\text{FiFam}^{\mathcal{I}}(\mathcal{A})^{\gamma^{-1}(T')}$ onto $\text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$, with inverse γ^{-1} .

Proof: By Lemma 1648, $\langle H, \gamma \rangle$ is $\widetilde{\Omega}^{\mathcal{I}}$ -compatible with T . This implies that, for every $T'' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{\gamma^{-1}(T')}$, $\text{Ker}(\langle H, \gamma \rangle)$ is compatible with T'' . It follows by Corollary 56 that, for all $T'' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{\gamma^{-1}(T')}$, $\gamma(T'') \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$. Moreover, the same compatibility property implies that $\gamma^{-1}(\gamma(T'')) = T''$, for all $T'' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{\gamma^{-1}(T')}$. Finally, by surjectivity of $\langle H, \gamma \rangle$, we get, for all $T''' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$, $\gamma(\gamma^{-1}(T''')) = T'''$. Therefore, $\gamma : \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{\gamma^{-1}(T')} \rightarrow \text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$ is a bijection and, since, clearly, both γ and γ^{-1} are order preserving, they are mutually inverse order isomorphisms, as claimed. ■

Now we are ready to return to the main line of work and establish that $\widetilde{\lambda}^{\mathcal{I}}$ constitutes a semi-coherent family of $\mathcal{I}$ -operators.

Theorem 1650 Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The Frege operator $\widetilde{\lambda}^{\mathcal{I}}$ is a semi-coherent family of $\mathcal{I}$ -operators.

Proof: Let $\mathcal{A}, \mathcal{B}$ be $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$, such that $\langle H, \gamma \rangle$ is $\widetilde{\lambda}^{\mathcal{I}}$ -compatible with $\gamma^{-1}(T')$. Then, by Lemma 1648 and Theorem 1649, $\gamma : \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{\gamma^{-1}(T')} \rightarrow \text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$ is an order isomorphism with inverse γ^{-1} . Thus, for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{\gamma^{-1}(T')}$, $\gamma(T) \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})^{T'}$ and $\gamma^{-1}(\gamma(T)) = T$. Now we get, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\begin{aligned} C_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T'_{H(\Sigma)}, \gamma_{\Sigma}(\phi)) &= C_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(\gamma_{\Sigma}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)})), \gamma_{\Sigma}(\phi)) \\ &= C_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(\gamma_{\Sigma}(C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)}), \phi))) \\ &= \gamma_{\Sigma}(C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)}), \phi)). \end{aligned}$$

Therefore, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\begin{aligned} \langle \phi, \psi \rangle &\in \gamma_{\Sigma}^{-1}(\widetilde{\lambda}_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T')) \\ \text{iff } &\langle \gamma_{\Sigma}(\phi), \gamma_{\Sigma}(\psi) \rangle \in \widetilde{\lambda}_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T') \\ \text{iff } &C_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T'_{H(\Sigma)}, \gamma_{\Sigma}(\phi)) = C_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T'_{H(\Sigma)}, \gamma_{\Sigma}(\psi)) \\ \text{iff } &\gamma_{\Sigma}(C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)}), \phi)) = \gamma_{\Sigma}(C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)}), \psi)) \\ \text{iff } &C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)}), \phi) = C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)}), \psi) \\ \text{iff } &\langle \phi, \psi \rangle \in \widetilde{\lambda}_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(T')). \end{aligned}$$

We conclude that $\widetilde{\lambda}^{\mathcal{I}}$ is semi-coherent. ■

It turns out that if we strengthen the semi-coherence condition by requiring that $\tilde{\lambda}^{\mathcal{I}}$ be commuting over all morphisms, with isomorphic signature components (regardless of compatibility), then we get a characterization of protoalgebraicity.

Theorem 1651 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is protoalgebraic if and only if $\tilde{\lambda}^{\mathcal{I}}$ is a semi-commuting family of $\mathcal{I}$ -operators.*

Proof: Suppose, first, that $\mathcal{I}$ is protoalgebraic and let $\mathcal{A}, \mathcal{B}$ be $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$. Then, by Corollary 55, $\gamma^{-1}(T') \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Let $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \mathbf{SEN}(\Sigma)$. Then

$$\begin{aligned} \langle \phi, \psi \rangle &\in \tilde{\lambda}_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(T')) \\ \text{iff } &C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)}), \phi) = C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\gamma_{\Sigma}^{-1}(T'_{H(\Sigma)}), \psi) \\ \text{iff } &C_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T'_{H(\Sigma)}, \gamma_{\Sigma}(\phi)) = C_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T'_{H(\Sigma)}, \gamma_{\Sigma}(\psi)) \\ \text{iff } &\langle \gamma_{\Sigma}(\phi), \gamma_{\Sigma}(\psi) \rangle \in \tilde{\lambda}_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T') \\ \text{iff } &\langle \phi, \psi \rangle \in \gamma_{\Sigma}^{-1}(\tilde{\lambda}_{H(\Sigma)}^{\mathcal{I}, \mathcal{B}}(T')). \end{aligned}$$

Therefore, $\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(T')) = \gamma^{-1}(\tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(T'))$ and $\tilde{\lambda}^{\mathcal{I}}$ is a semi-commuting family of $\mathcal{I}$ -operators.

Assume, conversely, that $\tilde{\lambda}^{\mathcal{I}}$ is semi-commuting and let $\mathcal{A}, \mathcal{B}$ be $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$. Since $\tilde{\Omega}^{\mathcal{I}, \mathcal{B}}(T') \leq \tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(T')$, we get

$$\gamma^{-1}(\tilde{\Omega}^{\mathcal{I}, \mathcal{B}}(T')) \leq \gamma^{-1}(\tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(T')) = \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(T')).$$

By Corollary 17, $\gamma^{-1}(\tilde{\Omega}^{\mathcal{I}, \mathcal{B}}(T'))$ is a congruence system on $\mathcal{A}$. By Proposition 1457, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(T'))$ is the largest congruence system below $\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(T'))$. Therefore, we get $\gamma^{-1}(\tilde{\Omega}^{\mathcal{I}, \mathcal{B}}(T')) \leq \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(T'))$. Since the converse inclusion always holds, $\tilde{\Omega}^{\mathcal{I}}$ is semi-commuting. Thus, by Corollary 1574, we get that $\tilde{\Omega}^{\mathcal{I}} = \Omega$ and, therefore, by Lemma 1555, $\mathcal{I}$ is protoalgebraic. ■

We also get a commutativity property with direct images.

Lemma 1652 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. If $\langle H, \gamma \rangle$ is $\tilde{\lambda}^{\mathcal{I}}$ -compatible with T , then*

$$\gamma(\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)) = \tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(\gamma(T)).$$

Proof: By hypothesis and Lemma 1648, $\langle H, \gamma \rangle$ is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T . Therefore, by Corollary 56, $\gamma(T) \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and, also, $T = \gamma^{-1}(\gamma(T))$. Since, by Theorem 1650, $\tilde{\lambda}^{\mathcal{I}}$ is semi-coherent, we get

$$\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T) = \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(\gamma(T))) = \gamma^{-1}(\tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(\gamma(T))).$$

Hence, by the surjectivity of $\langle H, \gamma \rangle$, we get $\gamma(\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)) = \tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(\gamma(T))$. ■

In analogy with previous correspondence theorems we have the following one regarding correspondence between Frege classes.

Theorem 1653 (Correspondence Theorem for Frege Classes) *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. If $\langle H, \gamma \rangle$ is $\tilde{\lambda}^{\mathcal{I}}$ -compatible with T , then γ induces an order isomorphism from $\llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$ onto $\llbracket \gamma(T) \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$, with inverse γ^{-1} .*

Proof: Since $\langle H, \gamma \rangle$ is $\tilde{\lambda}^{\mathcal{I}}$ -compatible with T , we get, by Lemma 1648, that $\langle H, \gamma \rangle$ is $\tilde{\Omega}^{\mathcal{I}}$ -compatible with T . Therefore, by Corollary 56, $\gamma(T) \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and, also, $T = \gamma^{-1}(\gamma(T))$.

Now, let $T' \in \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$. Then $\text{Ker}(\langle H, \gamma \rangle) \leq \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. As a consequence, we get $\gamma(T') \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and $\gamma^{-1}(\gamma(T')) = T'$. Now we get

$$\begin{aligned} \tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(\gamma(T)) &= \gamma(\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)) \quad (\text{by Lemma 1652}) \\ &\leq \gamma(\Omega^{\mathcal{A}}(T')) \quad (\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')) \\ &= \Omega^{\mathcal{B}}(\gamma(T')). \quad (\text{by Lemma 1579}). \end{aligned}$$

We conclude that $\gamma(T') \in \llbracket \gamma(T) \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$.

Suppose, conversely, that $T' \in \llbracket \gamma(T) \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$. Then $\tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(\gamma(T)) \leq \Omega^{\mathcal{B}}(T')$. By Corollary 55, $\gamma^{-1}(T') \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and, by surjectivity, $\gamma(\gamma^{-1}(T')) = T'$. Moreover, $\langle H, \gamma \rangle$ is $\tilde{\lambda}^{\mathcal{I}}$ -compatible with $\gamma^{-1}(\gamma(T)) = T$. Hence, we have

$$\begin{aligned} \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T) &= \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(\gamma^{-1}(\gamma(T))) \\ &= \gamma^{-1}(\tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(\gamma(T))) \quad (\text{by Theorem 1650}) \\ &\leq \gamma^{-1}(\Omega^{\mathcal{B}}(T')) \quad (\tilde{\lambda}^{\mathcal{I}, \mathcal{B}}(\gamma(T)) \leq \Omega^{\mathcal{B}}(T')) \\ &= \Omega^{\mathcal{A}}(\gamma^{-1}(T')). \quad (\text{by Proposition 24}) \end{aligned}$$

Hence, $\gamma^{-1}(T') \in \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$.

Thus, $\gamma : \llbracket T \rrbracket^{\tilde{\lambda}^{\mathcal{I}}} \rightarrow \llbracket \gamma(T) \rrbracket^{\tilde{\lambda}^{\mathcal{I}}}$ is a bijection, with inverse γ^{-1} . Since both mappings are order-preserving, we conclude that they form a pair of mutually inverse order isomorphisms. ■

This correspondence theorem allows us to provide characterizations of full self extensionality and full strong Fregeanity in the following two corollaries.

Corollary 1654 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is fully self extensional if and only if, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, $\tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$.*

Proof: Suppose, first, that $\mathcal{I}$ is fully self extensional and let $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$. Then we have

$$\begin{aligned} \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})) &= \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})) \\ &\quad (\text{by full self extensionality}) \\ &= \Delta^{\mathcal{A}}. \quad (\text{since } \mathcal{A} \in \text{AlgSys}(\mathcal{I})) \end{aligned}$$

Suppose, conversely, that, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, $\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$, and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system. Set, for notational convenience and brevity, $\mathcal{B} = \mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A}))$, and consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{B}.$$

Then $\text{Ker}(\langle I, \pi \rangle) = \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A}))$, whence $\text{Ker}(\langle I, \pi \rangle)$ is compatible with $\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Hence, we get, by Corollary 56, $\pi(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})) \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and $\pi^{-1}(\pi(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A}))) = \cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Since, $\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ is the least $\mathcal{I}$ -family of $\mathcal{A}$, it must be a Suszko $\mathcal{I}$ -filter family. Hence, by Corollary 1591, $\pi(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A}))$ is the least $\mathcal{I}$ -filter family on $\mathcal{B}$, i.e., we have

$$\pi(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \cap \text{FiFam}^{\mathcal{I}}(\mathcal{B}).$$

Since $\text{Ker}(\langle I, \pi \rangle) = \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})) \leq \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A}))$, $\langle I, \pi \rangle$ is $\tilde{\lambda}^{\mathcal{I},\mathcal{A}}$ -compatible with $\pi^{-1}(\pi(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A}))) = \cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Moreover, since $\mathcal{B} \in \text{AlgSys}(\mathcal{I})$, we get, by hypothesis, $\tilde{\lambda}^{\mathcal{I},\mathcal{B}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{B})) = \Delta^{\mathcal{B}}$. Now we get

$$\begin{aligned} \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})) &= \text{Ker}(\langle I, \pi \rangle) \quad (\text{definition of } \langle I, \pi \rangle) \\ &= \pi^{-1}(\Delta^{\mathcal{B}}) \quad (\text{definition of kernel}) \\ &= \pi^{-1}(\tilde{\lambda}^{\mathcal{I},\mathcal{B}}(\pi(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})))) \\ &\quad (\text{shown above}) \\ &= \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(\pi^{-1}(\pi(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})))) \\ &\quad (\text{Theorem 1651}) \\ &= \tilde{\lambda}^{\mathcal{I},\mathcal{A}}(\cap \text{FiFam}^{\mathcal{I}}(\mathcal{A})). \end{aligned}$$

We conclude that $\mathcal{I}$ is fully self extensional. ■

Corollary 1655 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is fully strongly Fregean if and only if, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) = \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)$.*

Proof: The left-to-right implication follows directly by the definition of full strong Fregeanity. Assume, conversely, that, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\tilde{\lambda}^{\mathcal{I},\mathcal{A}}(T) = \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)$. Let $\mathcal{A}$ be an arbitrary $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T).$$

$\text{Ker}(\langle I, \pi \rangle) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$ is compatible with T . Hence $\pi(T) \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))$ and $\pi^{-1}(\pi(T)) = T$. Moreover, $\text{Ker}(\langle I, \pi \rangle) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T)$. Thus, $\langle I, \pi \rangle$ is $\tilde{\lambda}^{\mathcal{I}}$ -compatible with T . Since $\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \text{AlgSys}(\mathcal{I})$, we get, by hypothesis,

$$\tilde{\lambda}^{\mathcal{I}, \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}(\pi(T)) = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}(\pi(T)) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}.$$

Now we have

$$\begin{aligned} \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) &= \text{Ker}(\langle I, \pi \rangle) \quad (\text{definition of } \langle I, \pi \rangle) \\ &= \pi^{-1}(\Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}) \quad (\text{definition of kernel}) \\ &= \pi^{-1}(\tilde{\lambda}^{\mathcal{I}, \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}(\pi(T))) \quad (\text{shown above}) \\ &= \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(\pi^{-1}(\pi(T))) \quad (\text{Theorem 1651}) \\ &= \tilde{\lambda}^{\mathcal{I}, \mathcal{A}}(T). \end{aligned}$$

We conclude that $\mathcal{I}$ is fully strongly Fregean. ■

On the other hand, strong Fregeanity, combined with the existence of natural theorems, implies assertionality.

Corollary 1656 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is strongly Fregean and has natural theorems, then it is syntactically family assertional.*

Proof: Assume $\mathcal{I}$ is strongly Fregean and has natural theorems. Let $\vartheta^b : (\text{SEN}^b)^k \rightarrow \text{SEN}^b$ be a natural theorem. Then define $\tau^b : (\text{SEN}^b)^{k+1} \rightarrow \text{SEN}^b$ by

$$\tau^b := \{p^{k+1,0} \approx \vartheta^b \circ \langle p^{k+1,1}, \dots, p^{k+1,k} \rangle\}.$$

We show, first, that, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\vec{\chi}, \vec{\chi}' \in \text{SEN}^b(\Sigma)$, $\langle \vartheta_\Sigma^b(\vec{\chi}), \vartheta_\Sigma^b(\vec{\chi}') \rangle \in \Omega_\Sigma(T)$. Since, ϑ^b is a natural theorem, we have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\vec{\chi}, \vec{\chi}' \in \text{SEN}^b(\Sigma)$, $\vartheta_\Sigma^b(\vec{\chi}), \vartheta_\Sigma^b(\vec{\chi}') \in \text{Thm}_\Sigma(\mathcal{I})$. Therefore, we get $\langle \vartheta_\Sigma^b(\vec{\chi}), \vartheta_\Sigma^b(\vec{\chi}') \rangle \in \tilde{\lambda}_\Sigma^{\mathcal{I}}(T)$. Thus, by strong Fregeanity, $\langle \vartheta_\Sigma^b(\vec{\chi}), \vartheta_\Sigma^b(\vec{\chi}') \rangle \in \Omega_\Sigma^{\mathcal{I}}(T) \leq \Omega_\Sigma(T)$.

We show, next, that $\mathcal{I}$ is systemic. To this end, let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and $\phi \in \text{SEN}^b(\Sigma)$, such that $\phi \in T_\Sigma$. Let $t \in \text{Thm}_{\Sigma'}(\mathcal{I})$. Then, we have $\langle \phi, t \rangle \in \tilde{\lambda}_\Sigma^{\mathcal{I}}(T) = \tilde{\Omega}_\Sigma^{\mathcal{I}}(T)$. Hence, since $\tilde{\Omega}^{\mathcal{I}}(T)$ is a congruence system, we get $\langle \text{SEN}^b(f)(\phi), \text{SEN}^b(f)(t) \rangle \in \tilde{\Omega}_{\Sigma'}^{\mathcal{I}}(T) = \tilde{\lambda}_{\Sigma'}^{\mathcal{I}}(T)$. But $\text{SEN}^b(f)(t) \in \text{Thm}_{\Sigma'}(\mathcal{I}) \subseteq T_{\Sigma'}$ and, therefore, by compatibility, $\text{SEN}^b(f)(\phi) \in T_{\Sigma'}$. Hence, $T \in \text{ThSys}(\mathcal{I})$ and $\mathcal{I}$ is systemic.

Finally, we show that, for all $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{SEN}^b(\Sigma)$,

$$\phi \in T_\Sigma \quad \text{iff} \quad \tau_\Sigma^b[\phi] \leq \Omega_\Sigma(T).$$

Assume, first $\phi \in T_\Sigma$. By systemicity, for every $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, $\text{SEN}^b(f)(\phi) \in T_{\Sigma'}$. Therefore, for all $\vec{\chi}' \in \text{SEN}^b(\Sigma')$,

$$\langle \text{SEN}^b(f)(\phi), \vartheta_{\Sigma'}^b(\vec{\chi}') \rangle \in \tilde{\lambda}_{\Sigma'}^{\mathcal{I}}(T) = \tilde{\Omega}_{\Sigma'}^{\mathcal{I}}(T) \leq \Omega_{\Sigma'}(T).$$

If, conversely, for all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\tilde{\chi}' \in \mathbf{SEN}^b(\Sigma')$, we have $\langle \mathbf{SEN}^b(\phi), \vartheta_{\Sigma'}^b(\tilde{\chi}') \rangle \in \Omega_{\Sigma'}(T)$, then, in particular for $f = i_{\Sigma}$, we get, for all $\tilde{\chi} \in \mathbf{SEN}^b(\Sigma)$, $\langle \phi, \vartheta_{\Sigma}^b(\tilde{\chi}) \rangle \in \Omega_{\Sigma}(T)$. Since $\vartheta_{\Sigma}^b(\tilde{\chi}) \in \mathbf{Thm}_{\Sigma}(\mathcal{I}) \subseteq T_{\Sigma}$, we get, by compatibility, that $\phi \in T_{\Sigma}$. ■

Finally, combining this work with previously obtained results, we get the following corollary comparing the injectivity of the various $\mathcal{I}$ -operators we have studied.

Corollary 1657 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.*

- (a) *If $\tilde{\Omega}^{\mathcal{I}}$ is injective, then $\tilde{\Omega}$ is injective.*
- (b) *If Ω is injective, then $\tilde{\chi}^{\mathcal{I}}$ is injective.*

Proof:

- (a) If $\tilde{\Omega}^{\mathcal{I}}$ is injective, then, by Theorem 828, Ω is c-reflective. Thus, it is, a fortiori, injective.
- (b) If Ω is injective, then, necessarily, $\mathcal{I}$ has theorems. Therefore, by Theorem 495, we get that $\tilde{\chi}^{\mathcal{I}}$ is injective. ■

21.13 Leibniz Hierarchy Revisited

Using the Isomorphism Theorem 1445 between full $\mathcal{I}$ -structures and $\mathcal{I}$ -congruence systems, we obtain, in the case of protoalgebraic π -institutions, the following special isomorphism theorem between Leibniz $\mathcal{I}$ -filter families and $\mathcal{I}^*$ -congruence systems.

Proposition 1658 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a protoalgebraic π -institution based on $\mathbf{F}$. Then, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, the Leibniz operator $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism.*

Proof: By Theorem 1445, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$,

$$\tilde{\Omega}^{\mathcal{A}} : \mathbf{FStr}^{\mathcal{I}}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}}(\mathcal{A})$$

is an order isomorphism. By protoalgebraicity and Theorem 1619,

$$\mathbf{FStr}^{\mathcal{I}}(\mathcal{A}) = \{ \langle \mathcal{A}, \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T \rangle : T \in \mathbf{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \}.$$

Moreover, by protoalgebraicity, for all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T) = \Omega^{\mathcal{A}}(T)$ and, also, $\mathbf{ConSys}^{\mathcal{I}}(\mathcal{A}) = \mathbf{ConSys}^{\mathcal{I}^*}(\mathcal{A})$. Therefore, we get that $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism. ■

We now show that $\Omega^{\mathcal{A}}$, as a mapping from Leibniz $\mathcal{I}$ -filter families to $\mathcal{I}^*$ -congruence systems on $\mathcal{I}$ -algebraic systems, being an order isomorphism is sufficient to establish that the same mapping is an order isomorphism for all $\mathbf{F}$ -algebraic systems.

Proposition 1659 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then, the following conditions are equivalent:*

- (i) *For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism;*
- (ii) *For every $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism.*

Proof: Since (i) $\Rightarrow$ (ii) is trivial, assume (ii) holds and let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an arbitrary $\mathbf{F}$ -algebraic system.

By Proposition 1565, $\Omega^{\mathcal{A}}$ is injective on $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$.

To show surjectivity, assume $\theta \in \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$. By definition, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\theta = \Omega^{\mathcal{A}}(T)$. Consider the quotient morphism $\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\Omega^{\mathcal{A}}(T)$. Since $\text{Ker}(\langle I, \pi \rangle) = \Omega^{\mathcal{A}}(T)$ is compatible with T , by Corollary 56, $\pi(T) \in \text{Fifam}^{\mathcal{I}}(\mathcal{A}/\Omega^{\mathcal{A}}(T))$. Since $\mathcal{A}/\Omega^{\mathcal{A}}(T) \in \text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$, we get, by hypothesis, that there exists $T' \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}/\Omega^{\mathcal{A}}(T))$, such that $\Omega^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\pi(T)) = \Omega^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(T')$. Now we have

$$\begin{aligned} \Omega^{\mathcal{A}}(T) &= \Omega^{\mathcal{A}}(\pi^{-1}(\pi(T))) \quad (\text{Ker}(\langle I, \pi \rangle) \text{ compatible with } T) \\ &= \pi^{-1}(\Omega^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\pi(T))) \\ &= \pi^{-1}(\Omega^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(T')) \\ &= \Omega^{\mathcal{A}}(\pi^{-1}(T')). \end{aligned}$$

Since $\text{Ker}(\langle I, \pi \rangle) = \Omega^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(\pi^{-1}(T'))$, we get that $\text{Ker}(\langle I, \pi \rangle)$ is compatible with $\pi^{-1}(T')$, and, hence, $\pi(\pi^{-1}(T')) = T' \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}/\Omega^{\mathcal{A}}(T))$. by Corollary 1612, $\pi^{-1}(T') \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. We showed that $\theta = \Omega^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(\pi^{-1}(T'))$, with $\pi^{-1}(T') \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. Therefore, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is surjective.

Next, we turn to monotonicity. To this end, let $T, T' \in \text{Fifam}^{\mathcal{I}^*}(\mathcal{A})$, such that $T \leq T'$. Consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T).$$

We have $\text{Ker}(\langle I, \pi \rangle) = \widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T)$ and, also, $\text{Ker}(\langle I, \pi \rangle) = \widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \leq \widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T') \leq \Omega^{\mathcal{A}}(T')$. Thus, by Corollary 56,

$$\pi(T), \pi(T') \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)).$$

Since $\mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) \in \text{AlgSys}(\mathcal{I})$, we get, by hypothesis, $\Omega^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)}(\pi(T)) \leq \Omega^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)}(\pi(T'))$. Therefore,

$$\begin{aligned} \Omega^{\mathcal{A}}(T) &= \Omega^{\mathcal{A}}(\pi^{-1}(\pi(T))) \quad (\text{compatibility}) \\ &= \pi^{-1}(\Omega^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)}(\pi(T))) \\ &\leq \pi^{-1}(\Omega^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)}(\pi(T'))) \\ &= \Omega^{\mathcal{A}}(\pi^{-1}(\pi(T'))) \\ &= \Omega^{\mathcal{A}}(T'). \end{aligned}$$

Hence $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is monotone. Finally, by Proposition 1565, $\Omega^{\mathcal{A}}$ is reflective on $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. Thus, we conclude that $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism. ■

Next, we show that, if $\Omega^{\mathcal{A}}$ from the Leibniz filter families onto the $\mathcal{I}^*$ -congruence systems happens to be an order isomorphism on every $\mathcal{I}$ -algebraic system, then the class of $\mathcal{I}$ -algebraic systems coincides with the class of $\mathcal{I}^*$ -algebraic systems.

Lemma 1660 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,*

$$\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$$

is an order isomorphism, then $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$.

Proof: By Corollary 1442, we know that $\text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$ always holds. So it suffices to show the reverse inclusion. To this end, let $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and let $T^m = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, for all $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, we have, by the hypothesis, $\Omega^{\mathcal{A}}(T^m) \leq \Omega^{\mathcal{A}}(T)$, which yields $\llbracket T \rrbracket^* \subseteq \llbracket T^m \rrbracket^*$.

Now let $T' \in \text{ThFam}^{\mathcal{I}}(\mathcal{A})$. By hypothesis, there exists $T \in \text{ThFam}^{\mathcal{I}^*}(\mathcal{A})$, such that $\Omega^{\mathcal{A}}(T') = \Omega^{\mathcal{A}}(T)$. Thus, we get $T' \in \llbracket T' \rrbracket^* = \llbracket T \rrbracket^* \subseteq \llbracket T^m \rrbracket^*$. Since this holds for every $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we conclude that $\llbracket T^m \rrbracket^* = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By Proposition 1615, we get $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) \in \text{AlgSys}^*(\mathcal{I})$ and, as, by hypothesis, $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and, hence, $\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$, we get $\mathcal{A} = \mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) \in \text{AlgSys}^*(\mathcal{I})$. We conclude that $\text{AlgSys}(\mathcal{I}) \subseteq \text{AlgSys}^*(\mathcal{I})$ and, therefore, the two classes of algebraic systems coincide. ■

The same conclusion may be drawn if we assume that $\Omega^{\mathcal{A}}$ is an order isomorphism from the collection of Suszko $\mathcal{I}$ -filter families to the collection of all $\mathcal{I}^*$ -congruence systems and, in fact, the proof follows along very similar lines.

Lemma 1661 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,*

$$\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$$

is an order isomorphism, then $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$.

Proof: By Corollary 1442, we know that $\text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$ always holds. So it suffices to show the reverse inclusion. To this end, let $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and let $T^m = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, for all $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, we have, by the hypothesis, $\Omega^{\mathcal{A}}(T^m) \leq \Omega^{\mathcal{A}}(T)$, which yields $\llbracket T \rrbracket^* \subseteq \llbracket T^m \rrbracket^*$.

Now let $T' \in \text{ThFam}^{\mathcal{I}}(\mathcal{A})$. By hypothesis, there exists $T \in \text{ThFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, such that $\Omega^{\mathcal{A}}(T') = \Omega^{\mathcal{A}}(T)$. Thus, we get $T' \in \llbracket T' \rrbracket^* = \llbracket T \rrbracket^* \subseteq \llbracket T^m \rrbracket^*$. Since this holds for every $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we conclude that $\llbracket T^m \rrbracket^* = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By Proposition 1615, we get $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) \in \text{AlgSys}^*(\mathcal{I})$ and, as, by hypothesis, $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and, hence, $\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$, we get $\mathcal{A} = \mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) \in \text{AlgSys}^*(\mathcal{I})$. We conclude that $\text{AlgSys}(\mathcal{I}) \subseteq \text{AlgSys}^*(\mathcal{I})$ and, therefore, the two classes of algebraic systems coincide. ■

We know that, under protoalgebraicity, $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$. The converse is true when family c-reflectivity is also assumed.

Proposition 1662 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a family completely reflective π -institution based on $\mathbf{F}$. If $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$, then $\mathcal{I}$ is protoalgebraic.*

Proof: Assume that $\mathcal{I}$ is family c-reflective and that $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$. By Proposition 1616, every full $\mathcal{I}$ -structure on an $\mathbf{F}$ -algebraic system $\mathcal{A}$ has the form $\langle \mathcal{A}, \llbracket T \rrbracket^* \rangle$, for some $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By Proposition 1621, then, for every $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, there exists $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\llbracket T \rrbracket^{\text{Su}} = \llbracket T' \rrbracket^*$. Hence, $T^{\text{Su}} = T'^*$. Now we have

$$\begin{aligned} T &= T^{\text{Su}} \quad (\text{by Theorem 1627}) \\ &= T'^* \quad (\text{shown above}) \\ &= T'. \quad (\text{by Lemma 1620}) \end{aligned}$$

We conclude that $\llbracket T \rrbracket^{\text{Su}} = \llbracket T \rrbracket^*$. Since this holds, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we conclude, by Proposition 1638, that $\mathcal{I}$ is protoalgebraic. ■

By Lemma 1660, we may replace equality of the two classes of algebraic system in Proposition 1662 by the condition that the Leibniz operator be an order isomorphism.

Proposition 1663 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a family completely reflective π -institution based on $\mathbf{F}$. If, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}*}(\mathcal{A})$ is an order isomorphism, then $\mathcal{I}$ is protoalgebraic.*

Proof: By Proposition 1662 and Lemma 1660. ■

We also get a characterization of weak family algebraizability.

Corollary 1664 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is weakly family algebraizable if and only if it is family c-reflective and $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$.*

Proof: If $\mathcal{I}$ is weakly family algebraizable, then it is, by definition, family c-reflective and protoalgebraic. By protoalgebraicity, $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$. On the other hand, if $\mathcal{I}$ is family c-reflective and $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$, then it is family c-reflective and, by Proposition 1662, it is also protoalgebraic. Hence, $\mathcal{I}$ is weakly family algebraizable. ■

If, in Proposition 1663, we drop the hypothesis of $\mathcal{I}$ being family c-reflective, but compensate by assuming that Ω^A is an order isomorphism between the collection of Suszko filter families and $\mathcal{I}^*$ -congruence systems on all $\mathbf{F}$ -algebraic systems, then we can still infer the protoalgebraicity of $\mathcal{I}$.

Theorem 1665 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is protoalgebraic if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Omega^A : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism.*

Proof: By Proposition 1658, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$, $\Omega^A : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism. By protoalgebraicity and Theorem 1638, $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Therefore, $\Omega^A : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism.

Conversely, assume that, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$, $\Omega^A : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism. By Lemma 1555, it suffices to show that the Leibniz and Suszko operators on an arbitrary $\mathbf{F}$ -algebraic system coincide. To this end, let $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

- Note that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \text{ConSys}^{\mathcal{I}}(\mathcal{A})$. By Lemma 1661 and the hypothesis, there exists $T' \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Omega^A(T')$. Hence, $\llbracket T \rrbracket^{\text{Su}} = \llbracket T' \rrbracket^*$ and, therefore, by Lemma 1620, $T^{\text{Su}} = T'^* = T'$. We conclude that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Omega^A(T^{\text{Su}})$.
- Note that $\Omega^A(T) \in \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$. Thus, there exists, by hypothesis, $T'' \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, such that $\Omega^A(T) = \Omega^A(T'')$. So $\llbracket T \rrbracket^* = \llbracket T'' \rrbracket^*$. Hence, by Lemma 1620, $T^* = T''^* = T''$. This gives $\Omega^A(T) = \Omega^A(T^*)$. Since $T^* = T'' \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, $(T^*)^{\text{Su}} = T^*$. But, by Lemma 1605, $T^* \leq T$. Hence, $\llbracket T \rrbracket^{\text{Su}} \subseteq \llbracket T^* \rrbracket^{\text{Su}}$ and, thus, $T^* = (T^*)^{\text{Su}} \leq T^{\text{Su}}$. By Lemma 1620, the reverse inclusion always holds, whence $T^* = T^{\text{Su}}$. Now we get $\Omega^A(T) = \Omega^A(T^{\text{Su}})$.

Since, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Omega^A(T^{\text{Su}}) = \Omega^A(T)$, we get that $\mathcal{I}$ is a protoalgebraic π -institution. ■

Theorem 1665 allows us to give a related characterization of equivalential π -institutions.

Corollary 1666 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is family equivalential if and only if it is family commuting and, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism.*

Proof: Suppose, first, that $\mathcal{I}$ is family equivalential. Then, by definition, $\mathcal{I}$ is family extensional and protoalgebraic. Thus, by Theorem 327, it is family inverse commuting and, by Theorem 325, it is family commuting. Moreover, by Theorem 1665, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism.

Assume, conversely, that $\mathcal{I}$ is family commuting and that, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism. Then, by Theorem 1665, it is protoalgebraic. Therefore, by Theorem 325, it is family inverse commuting and, by Theorem 327, it is family extensional. Being protoalgebraic and family extensional, it is, by definition, family equivalential. ■

We turn now to establishing some characterizations of semantic classes in the Leibniz hierarchy via the use of the Suszko operator. First, we show that the family c-reflectivity of the Leibniz operator is equivalent with the universal injectivity of the Suszko operator and, in turn, a sufficient (and, trivially, necessary) condition for it is the injectivity of the Suszko operator on an $\mathcal{I}$ -algebraic systems.

Theorem 1667 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}$ is family c-reflective;
- (ii) $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is injective, for all $\mathcal{A} \in \mathbf{AlgSys}(\mathbf{F})$;
- (iii) $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is injective, for all $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I})$.

Proof:

(i) $\Rightarrow$ (ii) By Proposition 1565, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is injective on $\mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. By hypothesis and Theorem 1627, $\mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) = \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. Thus, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is injective, for all $\mathcal{A} \in \mathbf{AlgSys}(\mathbf{F})$.

(ii) $\Rightarrow$ (iii) Trivial.

(iii) $\Rightarrow$ (i) We use again Theorem 1627, showing that for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) = \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. To this end, let $\mathcal{A} \in \mathbf{AlgSys}(\mathbf{F})$ and $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. Consider $T^m = \bigcap \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A} / \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))$. We have $\mathcal{A} / \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \mathbf{AlgSys}(\mathcal{I})$ and, by Corollary 56, $T / \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A} / \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))$.

Hence, by assumption, $T^m \leq T/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)$. By monotonicity of the Suszko operator, Proposition 1581 and Lemma 1594,

$$\tilde{\Omega}^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)}(T^m) \leq \tilde{\Omega}^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)}(T/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)}.$$

Hence, by hypothesis, $T/\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) = T^m$. Therefore, by Proposition 1624, $T \in \text{FiFam}^{\mathcal{I},\text{Su}}(\mathcal{A})$. This proves that $\text{FiFam}^{\mathcal{I},\text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and, by Theorem 1627, yields that $\mathcal{I}$ is family c-reflective. ■

As regards protoalgebraicity, we have the following characterization.

Theorem 1668 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is protoalgebraic if and only if $\tilde{\Omega}^{\mathcal{I}}$ is commuting.*

Proof: If $\mathcal{I}$ is protoalgebraic, then, by Lemma 1555, $\tilde{\Omega}^{\mathcal{I}} = \Omega$ and, by Proposition 24, $\tilde{\Omega}^{\mathcal{I}}$ is commuting. If, conversely, $\tilde{\Omega}^{\mathcal{I}}$ is commuting, then, by Corollary 1574, $\tilde{\Omega}^{\mathcal{I}} = \Omega$. Therefore, by Lemma 1555, $\mathcal{I}$ is protoalgebraic. ■

We also get characterizations for equivalential, weakly algebraizable and algebraizable π -institutions.

Theorem 1669 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.*

- (a) $\mathcal{I}$ is family equivalential if and only if $\tilde{\Omega}^{\mathcal{I}}$ is commuting and family extensional.
- (b) $\mathcal{I}$ is weakly family algebraizable if and only if $\tilde{\Omega}^{\mathcal{I}}$ is injective and commuting.
- (c) $\mathcal{I}$ is family algebraizable if and only if $\tilde{\Omega}^{\mathcal{I}}$ is injective and commuting and family extensional.

Proof:

- (a) Suppose $\mathcal{I}$ is equivalential. Then, by Theorem 334, Ω is monotone and family extensional. By Lemma 1555, $\Omega = \tilde{\Omega}^{\mathcal{I}}$. Thus, by Proposition 24, $\tilde{\Omega}^{\mathcal{I}}$ is commuting and family extensional. Conversely, if $\tilde{\Omega}^{\mathcal{I}}$ is commuting and family extensional, then, by Corollary 1574, $\tilde{\Omega}^{\mathcal{I}} = \Omega$. Thus, Ω is monotone and family extensional. By Theorem 334, $\mathcal{I}$ is family equivalential.
- (b) By Theorems 1667 and 1668.
- (c) By Part (a) and Theorem 1667.

■

In general, it is not hard to show that the Suszko operator on an $\mathbf{F}$ -algebraic system is an order embedding from the collection of Suszko $\mathcal{I}$ -filter families into the family of $\mathcal{I}$ -congruence systems.

Proposition 1670 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$,*

$$\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$$

is an order embedding.

Proof: The Suszko operator $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is always into $\text{ConSys}^{\mathcal{I}}(\mathcal{A})$. It is monotone by definition, and it is order-reflecting on $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$ by Proposition 1565. Therefore, it is an order embedding, as claimed. ■

Requiring the preceding embedding to be an order isomorphism turns out to be equivalent to the protoalgebraicity of $\mathcal{I}$.

Theorem 1671 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}$ is protoalgebraic;
- (ii) $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order isomorphism, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$;
- (iii) $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is surjective, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$.

Proof:

(i)⇒(ii) By hypothesis and Lemma 1555, $\Omega^{\mathcal{A}} = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$. Thus, by Proposition 1617, $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I})$. It follows that $\text{ConSys}^{\mathcal{I}}(\mathcal{A}) = \text{ConSys}^{\mathcal{I}*}(\mathcal{A})$. Now, by Theorem 1665, we get that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order isomorphism.

(ii)⇒(iii) Trivial.

(iii)⇒(i) Assume (iii). We show that the Leibniz operator $\Omega^{\mathcal{A}}$ is monotone on the $\mathcal{I}$ -filter families of every $\mathbf{F}$ -algebraic system $\mathcal{A}$. To this end, let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $T \leq T'$. Since $\Omega^{\mathcal{A}}(T) \in \text{ConSys}^{\mathcal{I}*}(\mathcal{A}) \subseteq \text{ConSys}^{\mathcal{I}}(\mathcal{A})$, there exists, by hypothesis, $T'' \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T'') = \Omega^{\mathcal{A}}(T)$. Thus, we have

$$\begin{aligned} \tilde{\Omega}^{\mathcal{A}}(\llbracket T'' \rrbracket^{\text{Su}}) &= \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T'') \\ &= \Omega^{\mathcal{A}}(T) \\ &= \tilde{\Omega}^{\mathcal{A}}(\llbracket T \rrbracket^*). \end{aligned}$$

Since $\langle \mathcal{A}, \llbracket T'' \rrbracket^{\text{Su}} \rangle, \langle \mathcal{A}, \llbracket T \rrbracket^* \rangle \in \text{FStr}(\mathcal{I})$, by Theorem 1445, $\llbracket T'' \rrbracket^{\text{Su}} = \llbracket T \rrbracket^*$. Moreover, since $T'' \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, by Lemma 1620, we obtain $\llbracket T'' \rrbracket^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{T''}$. Since $T \in \llbracket T \rrbracket^* = \llbracket T'' \rrbracket^{\text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{T''}$, we get $T'' \leq T \leq T'$. Thus, $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})^{T''} = \llbracket T'' \rrbracket^{\text{Su}} = \llbracket T \rrbracket^*$. In other words, $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. We conclude that $\Omega^{\mathcal{A}}$ is monotone on every $\mathcal{A}$, whence $\mathcal{I}$ is protoalgebraic. $\blacksquare$

In closing the section, we exploit Theorem 1671 to provide characterizations of some of the classes of the semantic Leibniz hierarchy.

Theorem 1672 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.*

- (a) *$\mathcal{I}$ is protoalgebraic if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order isomorphism;*
- (b) *$\mathcal{I}$ is family c-reflective if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order embedding;*
- (c) *$\mathcal{I}$ is weakly family algebraizable if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order isomorphism;*
- (d) *$\mathcal{I}$ is family algebraizable if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order isomorphism and $\mathcal{I}$ is family extensional.*

Proof:

- (a) By Theorem 1671.
- (b) By Proposition 1670, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is always an order embedding. By Theorem 1627, family c-reflectivity implies $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. We conclude that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order embedding. If, conversely, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order embedding, then it is injective on $\text{FiFam}^{\mathcal{I}}(\mathcal{A})$, whence, by Theorem 1667, $\mathcal{I}$ is family c-reflective.
- (c) Assume, first, that $\mathcal{I}$ is weakly family algebraizable. By Theorem 1665, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism. By Theorem 1627, $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Therefore, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism. Finally, by protoalgebraicity and Lemma 1555, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} = \Omega^{\mathcal{A}}$, and by protoalgebraicity and Proposition 1617, $\text{ConSys}^{\mathcal{I}^*}(\mathcal{A}) = \text{ConSys}^{\mathcal{I}}(\mathcal{A})$. Thus, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order isomorphism.

If, conversely, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order isomorphism, then, by Theorem 1667, $\mathcal{I}$ is family c-reflective, whence, by

Theorem 1627, $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and, hence, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is onto $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Thus, by Theorem 1671, $\mathcal{I}$ is protoalgebraic. We conclude that $\mathcal{I}$ is weakly family algebraizable.

(d) By Part (c) and the definition of family algebraizability. ■

21.14 Suszko Operator and Truth Equationality

Recall that by Proposition 68 and Proposition 28, it makes sense, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, to consider the relative congruence system $\Theta^{\mathcal{I}, \mathcal{A}}(R) := \Theta^{\text{AlgSys}(\mathcal{I}), \mathcal{A}}(R)$ on $\mathcal{A}$ generated by a relation family $R \in \text{RelFam}(\mathcal{A})$.

Lemma 1673 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b . For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $X \in \text{SenFam}(\mathcal{A})$, if $\theta = \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[X])$ and $\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\theta$ is the quotient morphism, then*

$$\text{FiFam}^{\mathcal{I}}(\mathcal{A}/\theta) = \pi(\text{FiFam}^{\mathcal{I}}(\mathcal{A})^X) \text{ and } \pi^{-1}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}/\theta)) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^X.$$

Proof: Let us set

$$\mathcal{T} = \{T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[X]) \leq \Omega^{\mathcal{A}}(T)\}.$$

By Proposition 1561, $\text{FiFam}^{\mathcal{I}}(\mathcal{A}/\theta) = \pi(\mathcal{T})$ and $\pi^{-1}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}/\theta)) = \mathcal{T}$. But we also have

$$\begin{aligned} \mathcal{T} &= \{T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \theta \leq \Omega^{\mathcal{A}}(T)\} \\ &\quad (\text{definition of } \mathcal{T}) \\ &= \{T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tau^{\mathcal{A}}[X] \leq \Omega^{\mathcal{A}}(T)\} \\ &\quad (\text{since } \theta = \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[X]) \text{ and } \Omega^{\mathcal{A}}(T) \in \text{ConSys}^{\mathcal{I}}(\mathcal{A})) \\ &= \{T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : X \leq T\} \\ &\quad (\text{by family truth equationality}) \\ &= \text{FiFam}^{\mathcal{I}}(\mathcal{A})^X. \quad (\text{definition of } \text{FiFam}^{\mathcal{I}}(\mathcal{A})^X) \end{aligned}$$

The conclusion follows. ■

We show, next that, under the same hypotheses, the Suszko congruence system of an $\mathcal{I}$ -filter family generated by a sentence family X equals the least $\mathcal{I}$ -congruence system on $\mathcal{A}$ generated by the relation family $\tau^{\mathcal{A}}[X]$.

Proposition 1674 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $X \in \mathbf{SenFam}(\mathcal{A})$,*

$$\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(X)) = \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[X]).$$

In particular, if $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[T])$.

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $X \in \mathbf{SenFam}(\mathcal{A})$ and set $\theta = \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[X])$. Since $\theta \in \mathbf{ConSys}^{\mathcal{I}}(\mathcal{A})$, we have $\mathcal{A}/\theta \in \mathbf{AlgSys}(\mathcal{I})$. Therefore,

$$\tilde{\Omega}^{\mathcal{A}/\theta}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}/\theta)) = \Delta^{\mathcal{A}/\theta}.$$

Consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\theta.$$

We have

$$\begin{aligned} \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(X)) &= \tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^X) \\ &= \tilde{\Omega}^{\mathcal{A}}(\pi^{-1}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}/\theta))) \quad (\text{Lemma 1673}) \\ &= \pi^{-1}(\tilde{\Omega}^{\mathcal{A}/\theta}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}/\theta))) \\ &= \pi^{-1}(\Delta^{\mathcal{A}/\theta}) \\ &= \theta. \end{aligned}$$

Therefore, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(X)) = \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[X])$, as was to be shown. $\blacksquare$

Proposition 1675 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . For every $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \mathbf{SEN}^b(\Sigma)$,*

$$\tilde{\Omega}^{\mathcal{I}}(C(\phi)) = \Theta^{\mathcal{I}}(\tau_{\Sigma}^b[\phi]).$$

Proof: Directly from Proposition 1674, letting $X = \{X_{\Sigma}\}_{\Sigma \in |\mathbf{Sign}^b|}$, where $X_{\Sigma} = \{\phi\}$ and $X_{\Sigma'} = \emptyset$, for all $\Sigma' \neq \Sigma$. $\blacksquare$

Another property is that the Suszko congruence family of the $\mathcal{I}$ -filter family generated by a sentence family X can be obtained as the join of the Suszko congruence families of the $\mathcal{I}$ -filter families generated by each singleton in X .

Proposition 1676 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $X \in \mathbf{SenFam}(\mathcal{A})$,*

$$\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(X)) = \bigvee \{ \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(\phi)) : \phi \in X_{\Sigma}, \Sigma \in |\mathbf{Sign}^b| \}.$$

Proof: Suppose $\mathcal{I}$ is family truth equational, with witnessing transformations $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b . Then, we have, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $X \in \text{SenFam}(\mathcal{A})$,

$$\begin{aligned} \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(X))) &= \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[X]) \\ &\quad (\text{by Proposition 1674}) \\ &= \bigvee \{ \Theta^{\mathcal{I}, \mathcal{A}}(\tau_{\Sigma}^{\mathcal{A}}[\phi]) : \phi \in X_{\Sigma}, \Sigma \in |\mathbf{Sign}| \} \\ &\quad (\text{by Proposition 35}) \\ &= \bigvee \{ \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(\phi)) : \phi \in X_{\Sigma}, \Sigma \in |\mathbf{Sign}| \}. \\ &\quad (\text{by Proposition 1674}) \end{aligned}$$

This proves the statement. ■

More generally, we have

Proposition 1677 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $\{T^i : i \in I\} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}\left(\bigvee_{i \in I}^{\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})} T^i\right) = \bigvee_{i \in I}^{\mathbf{ConSys}^{\mathcal{I}}(\mathcal{A})} \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T^i).$$

Proof: Suppose $\mathcal{I}$ is family truth equational, with witnessing transformations $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $\{T^i : i \in I\} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, we have

$$\begin{aligned} \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(\bigvee_{i \in I} T^i) &= \tilde{\Omega}(C^{\mathcal{I}, \mathcal{A}}(\bigcup_{i \in I} T^i)) \quad (\text{joins in } \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})) \\ &= \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[\bigcup_{i \in I} T^i]) \quad (\text{Proposition 1674}) \\ &= \Theta^{\mathcal{I}, \mathcal{A}}(\bigcup_{i \in I} \tau^{\mathcal{A}}[T^i]) \\ &= \bigvee_{i \in I} \Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[T^i]) \quad (\text{joins in } \mathbf{ConSys}^{\mathcal{I}}(\mathcal{A})) \\ &= \bigvee_{i \in I} \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T^i). \quad (\text{Proposition 1674}) \end{aligned}$$

This proves the statement. ■

Another property is the commutativity of the Suszko operator with surjective morphisms with isomorphic functor components.

Proposition 1678 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$. For all $\mathbf{F}$ -algebraic systems $\mathcal{A}, \mathcal{B}$, all surjective morphisms $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$, with H an isomorphism, and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$\tilde{\Omega}^{\mathcal{I}, \mathcal{B}}(C^{\mathcal{I}, \mathcal{B}}(\gamma(T))) = \Theta^{\mathcal{I}, \mathcal{B}}(\gamma(\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))).$$

Proof: Suppose $\mathcal{I}$ is family truth equational, with witnessing transformations $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , and let $\mathcal{A}, \mathcal{B}$ be $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. We now get

$$\begin{aligned} \tilde{\Omega}^{\mathcal{I}, \mathcal{B}}(C^{\mathcal{I}, \mathcal{B}}(\gamma(T))) &= \Theta^{\mathcal{I}, \mathcal{B}}(\tau^{\mathcal{B}}[\gamma(T)]) \quad (\text{by Proposition 1674}) \\ &= \Theta^{\mathcal{I}, \mathcal{B}}(\gamma(\Theta^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}[T]))) \quad (\text{by Proposition 34}) \\ &= \Theta^{\mathcal{I}, \mathcal{B}}(\gamma(\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))). \quad (\text{by Proposition 1674}) \end{aligned}$$

This proves the equality in the statement. $\blacksquare$

We now build a little further on our work of Section 12.3 in order to give another characterization of family truth equationality.

Let $\mathbf{K} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$ and $\mathbf{K}' = \langle \mathbf{Sign}', \text{SEN}', N' \rangle$ be algebraic systems and $\mathcal{K} = \langle \mathbf{K}, D \rangle$ and $\mathcal{K}' = \langle \mathbf{K}', D' \rangle$ be two π -structures based on $\mathbf{K}$ and $\mathbf{K}'$, respectively. Consider an order embedding

$$h : \mathbf{ThFam}(\mathcal{K}) \rightarrow \mathbf{ThFam}(\mathcal{K}').$$

Recall that $\overleftarrow{h} = \{\overleftarrow{h}_\Sigma\}_{\Sigma \in |\mathbf{Sign}|}$ is defined, for all $\Sigma \in |\mathbf{Sign}|$, by letting

$$\overleftarrow{h}_\Sigma : \text{SEN}(\Sigma) \rightarrow \text{SenFam}(\mathbf{K}')$$

be given, for all $\phi \in \text{SEN}(\Sigma)$, by

$$\overleftarrow{h}_\Sigma[\phi] = h(D(\phi)).$$

Then we have the following analog of Lemma 897.

Lemma 1679 *Let $\mathbf{K} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$, $\mathbf{K}' = \langle \mathbf{Sign}', \text{SEN}', N' \rangle$ be algebraic systems, $\mathcal{K} = \langle \mathbf{K}, D \rangle$, $\mathcal{K}' = \langle \mathbf{K}', D' \rangle$ be π -structures based on $\mathbf{K}$, $\mathbf{K}'$, respectively, and $h : \mathbf{ThFam}(\mathcal{K}) \rightarrow \mathbf{ThFam}(\mathcal{K}')$ an order embedding, which preserves suprema. Then $\overleftarrow{h} : \mathcal{K} \rightarrow \mathcal{K}'$ is an interpretation.*

Proof: Suppose $h : \mathbf{ThFam}(\mathcal{K}') \rightarrow \mathbf{ThFam}(\mathcal{K})$ is an order embedding and let $\Sigma \in |\mathbf{Sign}|$ and $\Phi \cup \{\phi\} \subseteq \text{SEN}(\Sigma)$. Then we have

$$\begin{aligned} \phi \in D_\Sigma(\Phi) &\text{ iff } D(\phi) \leq D(\Phi) \\ &\text{ iff } h(D(\phi)) \leq h(D(\Phi)) \\ &\text{ iff } h(D(\phi)) \leq h(\bigvee \{D(\chi) : \chi \in \Phi\}) \\ &\text{ iff } h(D(\phi)) \leq \bigvee \{h(D(\chi)) : \chi \in \Phi\} \\ &\text{ iff } \overleftarrow{h}_\Sigma[\phi] \leq \bigvee \{\overleftarrow{h}_\Sigma[\chi] : \chi \in \Phi\} \\ &\text{ iff } \overleftarrow{h}_\Sigma[\phi] \leq D'(\overleftarrow{h}_\Sigma[\Phi]). \end{aligned}$$

Thus, $\overleftarrow{h} : \mathcal{K}' \rightarrow \mathcal{K}$ is indeed an interpretation. $\blacksquare$

Let $\mathbf{K} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$ be an algebraic system and $\mathcal{K} = \langle \mathbf{K}^k, D \rangle$ and $\mathcal{K}' = \langle \mathbf{K}^\ell, D' \rangle$ be two π -structures based on $\mathbf{K}^k$ and $\mathbf{K}^\ell$, respectively. Consider a suprema preserving order embedding

$$h : \mathbf{ThFam}(\mathcal{K}) \rightarrow \mathbf{ThFam}(\mathcal{K}').$$

We say that the order embedding $h : \mathbf{ThFam}(\mathcal{K}) \rightarrow \mathbf{ThFam}(\mathcal{K}')$ is **transformational** if there exists $\tau : \text{SEN}^\omega \rightarrow \text{SEN}^\ell$, with k distinguished arguments, such that, for all $\Sigma \in |\mathbf{Sign}|$ and all $\vec{\phi} \in \text{SEN}(\Sigma)^k$,

$$\overleftarrow{h}_\Sigma[\vec{\phi}] = D'(\tau_\Sigma[\vec{\phi}]).$$

We have the following analog of Lemma 902.

Lemma 1680 *Let $\mathbf{K} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$ be an algebraic system, $\mathcal{K} = \langle \mathbf{K}^k, D \rangle$, $\mathcal{K}' = \langle \mathbf{K}^\ell, D' \rangle$ be two π -structures and $h : \mathbf{ThFam}(\mathcal{K}) \rightarrow \mathbf{ThFam}(\mathcal{K}')$ a transformational suprema preserving order embedding induced by $\tau : \mathbf{K}^k \rightarrow \mathbf{K}^\ell$. Then, for all $\Sigma \in |\mathbf{Sign}|$, all $\Phi \subseteq \text{SEN}(\Sigma)^k$,*

$$h(D(\Phi)) = D'(\tau_\Sigma[\Phi]).$$

Proof: We have, for all $\Sigma \in |\mathbf{Sign}|$ and all $\Phi \subseteq \text{SEN}(\Sigma)^k$,

$$\begin{aligned} h(D(\Phi)) &= h(\bigvee_{\phi \in \Phi} D(\phi)) \quad (\text{join in } \mathbf{ThFam}(\mathcal{K})) \\ &= \bigvee_{\phi \in \Phi} h(D(\phi)) \quad (h \text{ suprema preserving}) \\ &= \bigvee_{\phi \in \Phi} D'(\tau_\Sigma[\phi]) \quad (\overleftarrow{h}_\Sigma[\phi] = D'(\tau_\Sigma[\phi])) \\ &= D'(\bigcup_{\phi \in \Phi} \tau_\Sigma[\phi]) \quad (\text{join in } \mathbf{ThFam}(\mathcal{K}')) \\ &= D'(\tau_\Sigma[\Phi]). \quad (\text{by definition}) \end{aligned}$$

This proves the equality of the statement. ■

Furthermore, we have an analog of Theorem 903:

Theorem 1681 *Let $\mathbf{K} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$ be an algebraic system, $\mathcal{K} = \langle \mathbf{K}^k, D \rangle$, $\mathcal{K}' = \langle \mathbf{K}^\ell, D' \rangle$ be two π -structures and $h : \mathbf{ThFam}(\mathcal{K}') \rightarrow \mathbf{ThFam}(\mathcal{K})$ a transformational suprema preserving order embedding induced by $\tau : \mathbf{K}^k \rightarrow \mathbf{K}^\ell$. Then $\tau : \mathcal{K} \rightarrow \mathcal{K}'$ is an interpretation.*

Proof: Let $\Sigma \in |\mathbf{Sign}|$ and $\Phi \cup \{\phi\} \subseteq \text{SEN}(\Sigma)^k$. We then have:

$$\begin{aligned} \phi \in D_\Sigma(\Phi) &\text{ iff } D_\Sigma(\phi) \leq D_\Sigma(\Phi) \\ &\text{ iff } h(D(\phi)) \leq h(D(\Phi)) \quad (h \text{ order embedding}) \\ &\text{ iff } D'(\tau_\Sigma[\phi]) \leq D'(\tau_\Sigma[\Phi]) \quad (\text{Lemma 1680}) \\ &\text{ iff } \tau_\Sigma[\phi] \leq D'(\tau_\Sigma[\Phi]). \end{aligned}$$

Thus, $\tau : \mathcal{K} \rightarrow \mathcal{K}'$ is an interpretation. ■

Now, we obtain the following theorem characterizing family truth equationality in terms of transformational suprema preserving order embeddings.

Theorem 1682 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is family truth equational if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}}(\mathcal{A})$ is a transformational suprema preserving order embedding.*

Proof: Suppose, first, that $\mathcal{I}$ is family truth equational, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$. Then, it is, a fortiori, family c-reflective, whence, by Theorem 1672, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}}(\mathcal{A})$ is an order embedding, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$. By Proposition 1674, $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}$ is transformational and, by Proposition 1677, it is suprema preserving.

Assume, conversely, that $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}}(\mathcal{A})$ is a transformational suprema preserving order embedding. Then, on the one hand, by Theorem 1672, $\mathcal{I}$ is family c-reflective, and, on the other, by definition, there exists $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$, such that $\tilde{\Omega}^{\mathcal{I}} : \mathbf{ThFam}(\mathcal{I}) \rightarrow \mathbf{ConSys}^{\mathcal{I}}(\mathcal{F})$ is induced by τ^b . Thus, by Theorem 1681, $\tau^b : \mathcal{I} \rightarrow \mathcal{Q}^{\mathbf{AlgSys}(\mathcal{I})}$ is an interpretation. Let $T \in \mathbf{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \mathbf{SEN}^b(\Sigma)$. we have

$$\begin{aligned} \phi \in T_\Sigma & \quad \text{iff} \quad \tau_\Sigma^b[\phi] \leq \Theta^{\mathcal{I}, \mathcal{F}}(\tau_\Sigma^b[T_\Sigma]) \quad (\tau^b \text{ an interpretation}) \\ & \quad \text{iff} \quad \tau_\Sigma^b[\phi] \leq \tilde{\Omega}^{\mathcal{I}}(T) \quad (\text{by Lemma 1680}) \\ & \quad \text{implies} \quad \tau_\Sigma^b[\phi] \leq \Omega(T). \quad (\tilde{\Omega}^{\mathcal{I}}(T) \leq \Omega(T)) \end{aligned}$$

If, conversely, $\tau_\Sigma^b[\phi] \leq \Omega(T)$, then $\Theta^{\mathcal{I}, \mathcal{F}}(\tau_\Sigma^b[\phi]) \leq \Omega(T)$, whence, by Lemma 1680, $\tilde{\Omega}^{\mathcal{I}}(C(\phi)) \leq \Omega(T)$. Thus, by family c-reflectivity and Lemma 1556, $\phi \in T_\Sigma$. Therefore, for all $T \in \mathbf{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \mathbf{SEN}^b(\Sigma)$,

$$\phi \in T_\Sigma \quad \text{iff} \quad \tau_\Sigma^b[\phi] \leq \Omega_\Sigma(T).$$

We conclude that $\mathcal{I}$ is family truth-equational, with witnessing transformations τ^b . ■

21.15 Relations With Algebraic Semantics

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.

Given a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems, recall the definition of the closure system $C^{\mathbf{K}, \tau} = \{C_\Sigma^{\mathbf{K}, \tau}\}_{\Sigma \in |\mathbf{Sign}^b|}$, where, for all $\Sigma \in |\mathbf{Sign}^b|$, $C_\Sigma^{\mathbf{K}, \tau} : \mathcal{P}(\mathbf{SEN}^b(\Sigma)) \rightarrow \mathcal{P}(\mathbf{SEN}^b(\Sigma))$ is given, for all $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$, by

$$\phi \in C_\Sigma^{\mathbf{K}, \tau}(\Phi) \quad \text{iff} \quad \tau_\Sigma^b[\phi] \leq C^{\mathbf{K}}(\tau_\Sigma^b[\Phi]).$$

Define the class $\mathbf{K}(\mathcal{I}, \tau)$ of $\mathbf{F}$ -algebraic systems by

$$\mathbf{K}(\mathcal{I}, \tau) = \{\mathcal{A} \in \mathbf{AlgSys}(\mathbf{F}) : C \leq C^{\mathcal{A}, \tau}\}.$$

The following proposition gives a characterization of this class.

Proposition 1683 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then*

$$\mathbf{K}(\mathcal{I}, \tau) = \{ \mathcal{A} \in \mathbf{AlgSys}(\mathbf{F}) : \tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}) \}.$$

Proof: Suppose, first, that $\mathcal{A} \in \mathbf{K}(\mathcal{I}, \tau)$. Let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$, such that $\phi \in C_\Sigma(\Phi)$ and $\alpha_\Sigma(\Phi) \subseteq \tau_{F(\Sigma)}^{\mathcal{A}}(\Delta^{\mathcal{A}})$. Then, by definition, $\tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_\Sigma(\Phi)] \leq \Delta^{\mathcal{A}}$. This implies $\alpha(\tau_\Sigma^b[\Phi]) \leq \Delta^{\mathcal{A}}$. Since, by hypothesis, $\phi \in C_\Sigma(\Phi)$ and $C \leq C^{\mathcal{A}, \tau}$, we get $\alpha(\tau_\Sigma^b[\phi]) \leq \Delta^{\mathcal{A}}$. Equivalently, $\tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_\Sigma(\phi)] \leq \Delta^{\mathcal{A}}$, i.e., $\alpha_\Sigma(\phi) \in \tau_{F(\Sigma)}^{\mathcal{A}}(\Delta^{\mathcal{A}})$. We conclude that $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. This proves the left-to-right inclusion.

Assume, conversely, that $\mathcal{A}$ is an $\mathbf{F}$ -algebraic system, such that $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. Let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$, such that $\phi \in C_\Sigma(\Phi)$ and $\alpha(\tau_\Sigma^b[\Phi]) \leq \Delta^{\mathcal{A}}$. Then $\tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_\Sigma(\Phi)] \leq \Delta^{\mathcal{A}}$, i.e., $\alpha_\Sigma(\Phi) \subseteq \tau_{F(\Sigma)}^{\mathcal{A}}(\Delta^{\mathcal{A}})$. Since, by hypothesis, $\phi \in C_\Sigma(\Phi)$ and $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, we get $\alpha_\Sigma(\phi) \in \tau_{F(\Sigma)}^{\mathcal{A}}(\Delta^{\mathcal{A}})$, whence $\tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_\Sigma(\phi)] \leq \Delta^{\mathcal{A}}$ or, equivalently, $\alpha(\tau_\Sigma^b[\phi]) \leq \Delta^{\mathcal{A}}$. We conclude that $\phi \in C_\Sigma^{\mathcal{A}, \tau}(\Phi)$ and, hence, $\mathcal{A} \in \mathbf{K}(\mathcal{I}, \tau)$. ■

It is readily inferred from the definition that, provided $\mathcal{I}$ has a τ^b -algebraic semantics, then the class $\mathbf{K}(\mathcal{I}, \tau)$ is the largest such.

Corollary 1684 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ has a τ^b -algebraic semantics, then $\mathbf{K}(\mathcal{I}, \tau)$ is its largest τ^b -algebraic semantics.*

Proof: Suppose $\mathbf{K}$ is a τ^b -algebraic semantics for $\mathcal{I}$ and let $\mathcal{A} \in \mathbf{K}$. Then, by the definition of τ^b -algebraic semantics and taking into account the membership $\mathcal{A} \in \mathbf{K}$, we get $C = C^{\mathbf{K}, \tau} \leq C^{\mathcal{A}, \tau}$. Therefore, by definition of $\mathbf{K}(\mathcal{I}, \tau)$, $\mathcal{A} \in \mathbf{K}(\mathcal{I}, \tau)$. We conclude that $\mathbf{K} \subseteq \mathbf{K}(\mathcal{I}, \tau)$. ■

we can also show that, if $\mathcal{I}$ is family truth equational, with witnessing transformations τ^b , then $\mathbf{AlgSys}(\mathcal{I})$ is a τ^b -algebraic semantics for $\mathcal{I}$.

Proposition 1685 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is family truth equational, with witnessing transformations τ^b , then $\mathbf{AlgSys}(\mathcal{I})$ is a τ^b -algebraic semantics for $\mathcal{I}$.*

Proof: We must show that $C = C^{\mathbf{AlgSys}(\mathcal{I}), \tau}$.

Let $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$, such that $\phi \in C_\Sigma(\Phi)$ and $\alpha(\tau_\Sigma^b[\Phi]) \leq \Delta^{\mathcal{A}}$. Since $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I})$, there exists $\mathcal{T} \subseteq$

$\text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \Delta^{\mathcal{A}}$. Hence, we get

$$\begin{aligned}
 \alpha(\tau_{\Sigma}^b[\Phi]) \leq \Delta^{\mathcal{A}} & \quad \text{iff} \quad \alpha(\tau_{\Sigma}^b[\Phi]) \leq \tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \\
 & \quad \text{iff} \quad \alpha(\tau_{\Sigma}^b[\Phi]) \leq \Omega^{\mathcal{A}}(T), \text{ for all } T \in \mathcal{T}, \\
 & \quad \text{iff} \quad \tau_{\Sigma}^b[\Phi] \leq \Omega(\alpha^{-1}(T)), \text{ for all } T \in \mathcal{T}, \\
 & \quad \text{iff} \quad \Phi \subseteq \alpha_{\Sigma}^{-1}(T), \text{ for all } T \in \mathcal{T}, \\
 & \quad \text{implies} \quad \phi \subseteq \alpha_{\Sigma}^{-1}(T), \text{ for all } T \in \mathcal{T}, \\
 & \quad \text{iff} \quad \tau_{\Sigma}^b[\phi] \leq \Omega(\alpha^{-1}(T)), \text{ for all } T \in \mathcal{T}, \\
 & \quad \text{iff} \quad \alpha(\tau_{\Sigma}^b[\phi]) \leq \Omega^{\mathcal{A}}(T), \text{ for all } T \in \mathcal{T}, \\
 & \quad \text{iff} \quad \alpha(\tau_{\Sigma}^b[\phi]) \leq \tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \\
 & \quad \text{iff} \quad \alpha(\tau_{\Sigma}^b[\phi]) \leq \Delta^{\mathcal{A}}.
 \end{aligned}$$

We conclude that $\phi \in C_{\Sigma}^{\text{AlgSys}(\mathcal{I}), \tau}(\Phi)$. Therefore, $C \leq C^{\text{AlgSys}(\mathcal{I}), \tau}$.

Suppose, conversely, that $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, such that $\phi \in C_{\Sigma}^{\text{AlgSys}(\mathcal{I}), \tau}(\Phi)$ and $T \in \text{ThFam}(\mathcal{I})$, such that $\Phi \subseteq T_{\Sigma}$. Then, we have $\tau_{\Sigma}^b[\Phi] \leq \Omega(T)$, i.e., $\tau_{\Sigma}^{\mathcal{F}/\Omega(T)}[\Phi/\Omega_{\Sigma}(T)] \leq \Delta^{\mathcal{F}/\Omega(T)}$. But $\mathcal{F}/\Omega(T) \in \text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$. Therefore, since $\phi \in C_{\Sigma}^{\text{AlgSys}(\mathcal{I}), \tau}(\Phi)$, we get that $\tau_{\Sigma}^{\mathcal{F}/\Omega(T)}[\phi/\Omega_{\Sigma}(T)] \leq \Delta^{\mathcal{F}/\Omega(T)}$, whence $\tau_{\Sigma}^b[\phi] \leq \Omega(T)$. Therefore, $\phi \in T_{\Sigma}$ and we conclude that $\phi \in C_{\Sigma}(\Phi)$. This proves that $C^{\text{AlgSys}(\mathcal{I}), \tau} \leq C$ and, as a result, equality follows.

We have now shown that $\text{AlgSys}(\mathcal{I})$ is a τ^b -algebraic semantics for $\mathcal{I}$. ■

Corollary 1686 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is family truth equational, with witnessing transformations τ^b , then $\text{AlgSys}(\mathcal{I}) \subseteq \mathbf{K}(\mathcal{I}, \tau)$.*

Proof: By Proposition 1685 and Corollary 1684. ■

For family truth equational π -institutions we have the following characterization of the least $\mathcal{I}$ -filter families on arbitrary algebraic systems and on $\mathcal{I}$ -algebraic systems.

Lemma 1687 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2$ in N^b .*

- (a) *For every $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$, $C^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}(\Delta^{\mathcal{A}})) = C^{\mathcal{I}, \mathcal{A}}(\emptyset)$;*
- (b) *For every $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = C^{\mathcal{I}, \mathcal{A}}(\emptyset)$.*

Proof:

- (a) Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system. We have $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \leq \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(\emptyset)))$. By family truth equationality, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \leq C^{\mathcal{I}, \mathcal{A}}(\emptyset)$. It follows that $C^{\mathcal{I}, \mathcal{A}}(\tau^{\mathcal{A}}(\Delta^{\mathcal{A}})) = C^{\mathcal{I}, \mathcal{A}}(\emptyset)$.

- (b) Let $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$. Then, by Part (a), $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \leq C^{\mathcal{I}, \mathcal{A}}(\emptyset)$. Assume, conversely, that $\Sigma \in |\mathbf{Sign}|$, $\phi \in \text{SEN}(\Sigma)$, such that $\phi \in C_{\Sigma}^{\mathcal{I}, \mathcal{A}}(\emptyset)$. Then, for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\phi \in T_{\Sigma} = \tau_{\Sigma}^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$, i.e., for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\tau_{\Sigma}^{\mathcal{A}}[\phi] \leq \Omega^{\mathcal{A}}(T)$. We conclude that $\tau_{\Sigma}^{\mathcal{A}}[\phi] \leq \widetilde{\Omega}^{\mathcal{I}, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(\emptyset)) = \Delta^{\mathcal{A}}$. This shows that $\phi \in \tau_{\Sigma}^{\mathcal{A}}(\Delta^{\mathcal{A}})$. Thus, $C^{\mathcal{I}, \mathcal{A}}(\emptyset) \leq \tau^{\mathcal{A}}(\Delta^{\mathcal{A}})$. Equality now follows. $\blacksquare$

So in the case of family truth equational π -institutions, we may strengthen the characterization of the class $\mathbf{K}(\mathcal{I}, \tau)$ given in Proposition 1683.

Proposition 1688 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2$ in N^b . Then*

$$\mathbf{K}(\mathcal{I}, \tau) = \{ \mathcal{A} \in \text{AlgSys}(\mathbf{F}) : \tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = C^{\mathcal{I}, \mathcal{A}}(\emptyset) \}.$$

Proof: Note that, taking into account Proposition 1683,

$$\begin{aligned} & \{ \mathcal{A} \in \text{AlgSys}(\mathbf{F}) : \tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = C^{\mathcal{I}, \mathcal{A}}(\emptyset) \} \\ & \subseteq \{ \mathcal{A} \in \text{AlgSys}(\mathbf{F}) : \tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \} \\ & = \mathbf{K}(\mathcal{I}, \tau). \end{aligned}$$

Assume, conversely, that $\mathcal{A} \in \mathbf{K}(\mathcal{I}, \tau)$. Then, by Proposition 1683, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and, by definition of $\mathbf{K}(\mathcal{I}, \tau)$, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \leq C^{\mathcal{I}, \mathcal{A}}(\emptyset)$. Hence $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = C^{\mathcal{I}, \mathcal{A}}(\emptyset)$. $\blacksquare$

Proposition 1688 has some interesting consequences. First, any two sets of witnessing transformations for truth equationality are, roughly speaking, deductively equivalent over any $\mathcal{I}$ -algebraic system.

Corollary 1689 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b \tau'^b : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is family truth equational, with witnessing transformations τ^b and τ'^b , then, for every $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,*

$$C^{\mathcal{A}}(\tau_{\Sigma}^b[\phi]) = C^{\mathcal{A}}(\tau'_{\Sigma}^b[\phi]).$$

Proof: Suppose $\mathcal{I}$ is family truth equational, with witnessing transformations τ^b and τ'^b and let $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and $\Sigma \in |\mathbf{Sign}^b|$, $\phi \in \text{SEN}^b(\Sigma)$, such that $\alpha(\tau_{\Sigma}^b[\phi]) \leq \Delta^{\mathcal{A}}$. This is equivalent to $\tau'_{F(\Sigma)}^{\mathcal{A}}[\alpha_{\Sigma}(\phi)] \leq \Delta^{\mathcal{A}}$, i.e., $\alpha_{\Sigma}(\phi) \in \tau'_{F(\Sigma)}^{\mathcal{A}}(\Delta^{\mathcal{A}})$. By Proposition 1688, $\alpha_{\Sigma}(\phi) \in C_{F(\Sigma)}^{\mathcal{I}, \mathcal{A}}(\emptyset)$. Again by Proposition 1688, $\alpha_{\Sigma}(\phi) \in \tau_{F(\Sigma)}^{\mathcal{A}}(\Delta^{\mathcal{A}})$. Thus, $\tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_{\Sigma}(\phi)] \leq \Delta^{\mathcal{A}}$. Hence, $\alpha_{\Sigma}(\tau_{\Sigma}^b[\phi]) \leq \Delta^{\mathcal{A}}$. This shows that $\tau_{\Sigma}^b[\phi] \leq C^{\mathcal{A}}(\tau'_{\Sigma}^b[\phi])$. By symmetry, we conclude that $C^{\mathcal{A}}(\tau_{\Sigma}^b[\phi]) = C^{\mathcal{A}}(\tau'_{\Sigma}^b[\phi])$. $\blacksquare$

Finally, the Suszko core S^b has a special position among all witnessing transformations. Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} =$

$\langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. Recall that the Suszko core of $\mathcal{I}$ is the collection

$$S^{\mathcal{I}} = \{\sigma^b \in N^b : (\forall T \in \text{ThFam}(\mathcal{I}))(\sigma^b[T] \leq \tilde{\Omega}(T))\}.$$

Recall, also, that, by Lemma 836, if $\mathcal{I}$ is truth equational, with witnessing equations $\tau^b \subseteq N^b$, then $\tau^b \subseteq S^{\mathcal{I}}$.

Corollary 1690 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b . Then*

$$\mathbf{K}(\mathcal{I}, S^{\mathcal{I}}) \subseteq \mathbf{K}(\mathcal{I}, \tau).$$

Proof: Suppose $\mathcal{A} \in \mathbf{K}(\mathcal{I}, S^{\mathcal{I}})$. By hypothesis and Lemma 836, $\tau^b \subseteq S^{\mathcal{I}}$. Hence $S^{\mathcal{I}}(\Delta^{\mathcal{A}}) \leq \tau^b(\Delta^{\mathcal{A}})$. But, by hypothesis, Theorem 841 and Proposition 1688, $S^{\mathcal{I}}(\Delta^{\mathcal{A}}) = C^{\mathcal{I}, \mathcal{A}}(\emptyset)$ and, by hypothesis and Lemma 1687, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \leq C^{\mathcal{I}, \mathcal{A}}(\emptyset)$. Hence, we have

$$C^{\mathcal{I}, \mathcal{A}}(\emptyset) = S^{\mathcal{I}}(\Delta^{\mathcal{A}}) \leq \tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \leq C^{\mathcal{I}, \mathcal{A}}(\emptyset).$$

Therefore, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = C^{\mathcal{I}, \mathcal{A}}(\emptyset)$ and, thus, by Proposition 1688, $\mathcal{A} \in \mathbf{K}(\mathcal{I}, \tau)$. We conclude that $\mathbf{K}(\mathcal{I}, S^{\mathcal{I}}) \subseteq \mathbf{K}(\mathcal{I}, \tau)$. ■

Corollary 1691 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a family truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b . Then $\mathbf{K}(\mathcal{I}, S^{\mathcal{I}})$ is a τ^b -algebraic semantics for $\mathcal{I}$.*

Proof: Observe that we have

$$\begin{aligned} \text{AlgSys}(\mathcal{I}) &\subseteq \mathbf{K}(\mathcal{I}, S^{\mathcal{I}}) \quad (\text{by Theorem 841 and Corollary 1686}) \\ &\subseteq \mathbf{K}(\mathcal{I}, \tau). \quad (\text{by Corollary 1690}) \end{aligned}$$

Since, by Proposition 1685, $\text{AlgSys}(\mathcal{I})$ is a τ^b -algebraic semantics for $\mathcal{I}$ and, by Corollary 1684, $\mathbf{K}(\mathcal{I}, \tau)$ is also a τ^b -algebraic semantics for $\mathcal{I}$, we conclude that $\mathbf{K}(\mathcal{I}, S^{\mathcal{I}})$ is one also. ■

21.16 The $\mathcal{I}$ -Operator $\Psi^{\mathbf{K}, \tau}$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, with a τ^b -algebraic semantics $\mathbf{K}$, such that $\text{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{K}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, we define the operator

$$\Psi^{\mathbf{K}, \tau, \mathcal{A}} : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rightarrow \text{EqvFam}(\mathcal{A})$$

by setting, for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,

$$\Psi^{\mathbf{K}, \tau, \mathcal{A}}(T) = \Theta^{\hat{\Pi}(\mathbf{K}), \mathcal{A}}(\tau^{\mathcal{A}}[T]).$$

Note that, by the hypotheses and Proposition 28, $\Psi^{\mathbf{K}, \tau, \mathcal{A}}$ is well-defined, since $\hat{\Pi}(\mathbf{K})$ -congruence systems on $\mathcal{A}$ form a closure system on $\mathcal{A}^2$.

It is the case that if a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems is a τ^b -algebraic semantics for a π -institution $\mathcal{I}$, then so is the larger class $\hat{\Pi}(\mathbf{K})$.

Proposition 1692 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems is a τ^b -algebraic semantics for $\mathcal{I}$, then so is $\hat{\Pi}(\mathbf{K})$.*

Proof: First, observe that $\mathbf{K} \subseteq \hat{\Pi}(\mathbf{K})$, whence $C^{\hat{\Pi}(\mathbf{K}), \tau} \leq C^{\mathbf{K}, \tau} = C$. To show the converse, let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, such that $\phi \in C_\Sigma(\Phi)$. Let

$$\langle H^i, \gamma^i \rangle : \mathcal{A} \rightarrow \mathcal{A}^i, \quad i \in I,$$

be a subdirect intersection, with $\mathcal{A}^i \in \mathbf{K}$, for all $i \in I$, and assume that $\alpha(\tau_\Sigma^b[\Phi]) \leq \Delta^{\mathcal{A}}$. Since, by definition $\Delta^{\mathcal{A}} = \bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle)$, we get that $\alpha(\tau_\Sigma^b[\Phi]) \leq \text{Ker}(\langle H^i, \gamma^i \rangle)$, for all $i \in I$, i.e., $\gamma^i(\alpha(\tau_\Sigma^b[\Phi])) \leq \Delta^{\mathcal{A}^i}$, $i \in I$, or, equivalently, $\alpha^i(\tau_\Sigma^b[\Phi]) \leq \Delta^{\mathcal{A}^i}$, $i \in I$. Since $\phi \in C_\Sigma(\Phi)$, $\mathcal{A}^i \in \mathbf{K}$, for all $i \in I$ and $\mathbf{K}$ is a τ^b -algebraic semantics for $\mathcal{I}$, we get $\alpha^i(\tau_\Sigma^b[\phi]) \leq \Delta^{\mathcal{A}^i}$, for all $i \in I$. We now reverse the steps above. We get $\gamma^i(\alpha(\tau_\Sigma^b[\phi])) \leq \Delta^{\mathcal{A}^i}$, $i \in I$, then $\alpha(\tau_\Sigma^b[\phi]) \leq \text{Ker}(\langle H^i, \gamma^i \rangle)$, $i \in I$, and, finally, $\alpha(\tau_\Sigma^b[\phi]) \leq \Delta^{\mathcal{A}}$. Thus, $\phi \in C_\Sigma^{\mathcal{A}, \tau}(\Phi)$. Since, for all $\mathcal{A} \in \hat{\Pi}(\mathbf{K})$, $C \leq C^{\mathcal{A}, \tau}$, we conclude that $C \leq C^{\hat{\Pi}(\mathbf{K}), \tau}$. Therefore, $\hat{\Pi}(\mathbf{K})$ is also a τ^b -algebraic semantics for $\mathcal{I}$. ■

Tying the operator $\Psi^{\mathbf{K}, \tau, \mathcal{A}}$ with our preceding work in this Chapter, we show that it is a congruential monotone compatibility $\mathcal{I}$ -operator on $\mathcal{A}$.

Proposition 1693 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, with a τ^b -algebraic semantics $\mathbf{K}$, such that $\text{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{K}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Psi^{\mathbf{K}, \tau, \mathcal{A}}$ is a congruential, monotone, compatibility $\mathcal{I}$ -operator on $\mathcal{A}$.*

Proof: $\Psi^{\mathbf{K}, \tau, \mathcal{A}}$ is, by definition, an $\mathcal{I}$ -operator on $\mathcal{A}$. It is congruential, since, again by definition, for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Theta^{\hat{\Pi}(\mathbf{K}), \mathcal{A}}(\tau^{\mathcal{A}}[T]) \in \text{ConSys}(\mathcal{A})$. It is monotone, since, for all $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, with $T \leq T'$, we get $\tau^{\mathcal{A}}[T] \leq \tau^{\mathcal{A}}[T']$ and, therefore, $\Theta^{\hat{\Pi}(\mathbf{K}), \mathcal{A}}(\tau^{\mathcal{A}}[T]) \leq \Theta^{\hat{\Pi}(\mathbf{K}), \mathcal{A}}(\tau^{\mathcal{A}}[T'])$.

To see that it is also a compatibility $\mathcal{I}$ -operator, consider $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Note, first, that

$$\begin{aligned} \text{AlgSys}(\mathcal{I}) &= \overset{\triangleleft}{\text{III}}(\text{AlgSys}^*(\mathcal{I})) \quad (\text{by Theorem 1441}) \\ &\subseteq \overset{\triangleleft}{\text{III}}(\mathbf{K}). \quad (\text{since } \text{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{K}) \end{aligned}$$

Thus, we get $\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) \in \text{ConSys}^{\mathcal{I}}(\mathcal{A}) \subseteq \text{ConSys}^{\overset{\triangleleft}{\text{III}}(\mathbf{K})}(\mathcal{A})$. Since, by Corollary 825, $\tau^{\mathcal{A}}[T] \leq \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T)$, we get

$$\Theta^{\overset{\triangleleft}{\text{III}}(\mathbf{K}),\mathcal{A}}(\tau^{\mathcal{A}}[T]) \leq \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T).$$

Therefore, $\Psi^{\mathbf{K},\tau,\mathcal{A}}$ is also a compatibility $\mathcal{I}$ -operator on $\mathcal{A}$. ■

It turns out that $\Psi^{\mathbf{K},\tau} = \{\Psi^{\mathbf{K},\tau,\mathcal{A}} : \mathcal{A} \in \text{AlgSys}(\mathbf{F})\}$ is also semi-coherent. To show this, we formulate two technical lemmas on the way.

Lemma 1694 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b . For all $\mathbf{F}$ -algebraic systems $\mathcal{A}, \mathcal{B}$, every surjective morphism $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$, with H an isomorphism, and all $T' \in \text{SenFam}(\mathcal{B})$,*

- (a) $\tau^{\mathcal{B}}[T'] = \gamma(\tau^{\mathcal{A}}[\gamma^{-1}(T')]);$
- (b) $\tau^{\mathcal{A}}[\gamma^{-1}(T')] \leq \gamma^{-1}(\tau^{\mathcal{B}}[T']).$

Proof: First, note that, for all $T \in \text{SenFam}(\mathcal{A})$, we have, taking into account the fact that $\langle H, \gamma \rangle$ is a surjective morphism, $\gamma(\tau^{\mathcal{A}}[T]) = \tau^{\mathcal{B}}[\gamma(T)]$. Now, we set $T = \gamma^{-1}(T')$. This gives

$$\gamma(\tau^{\mathcal{A}}[\gamma^{-1}(T')]) = \tau^{\mathcal{B}}[\gamma(\gamma^{-1}(T'))] = \tau^{\mathcal{B}}[T'],$$

which conclude the proof of Part (a). For Part (b), we have, using Part (a),

$$\tau^{\mathcal{A}}[\gamma^{-1}(T')] \leq \gamma^{-1}(\gamma(\tau^{\mathcal{A}}[\gamma^{-1}(T')])) = \gamma^{-1}(\tau^{\mathcal{B}}[T']).$$

■

Lemma 1695 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems, such that $\overset{\triangleleft}{\text{III}}(\mathbf{K}) \subseteq \mathbf{K}$. For all $\mathbf{F}$ -algebraic systems $\mathcal{A}, \mathcal{B}$, every surjective morphism $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$, with H an isomorphism, and all $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$,*

$$\begin{aligned} \{ \theta \in \text{ConSys}^{\mathbf{K}}(\mathcal{A}) : \text{Ker}(\langle H, \gamma \rangle) \leq \theta \text{ and } \tau^{\mathcal{A}}[\gamma^{-1}(T')] \leq \theta \} \\ = \{ \gamma^{-1}(\theta') : \theta' \in \text{ConSys}^{\mathbf{K}}(\mathcal{B}) \text{ and } \tau^{\mathcal{B}}[T'] \leq \theta' \}. \end{aligned}$$

Proof: Suppose $\mathbf{K}$ is closed under subdirect intersections and let $\mathcal{A}, \mathcal{B}$ be $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T' \in \text{SenFam}(\mathcal{B})$.

($\subseteq$) Let $\theta \in \text{ConSys}^{\mathbf{K}}(\mathcal{A})$, such that $\text{Ker}(\langle H, \gamma \rangle) \leq \theta$ and $\tau^{\mathcal{A}}[\gamma^{-1}(T')] \leq \theta$. By Lemma 1694, $\tau^{\mathcal{B}}[T'] = \gamma(\tau^{\mathcal{A}}[\gamma^{-1}(T')]) \leq \gamma(\theta)$. By Proposition 33, $\gamma(\theta) \in \text{ConSys}^{\mathbf{K}}(\mathcal{B})$. Finally, by Lemma 25, $\theta = \gamma^{-1}(\gamma(\theta))$. Hence, we get

$$\theta = \gamma^{-1}(\gamma(\theta)) \in \{\gamma^{-1}(\theta') : \theta' \in \text{ConSys}^{\mathbf{K}}(\mathcal{B}) \text{ and } \tau^{\mathcal{B}}[T'] \leq \theta'\}.$$

($\supseteq$) Suppose, now, $\theta' \in \text{ConSys}^{\mathbf{K}}(\mathcal{B})$, such that $\tau^{\mathcal{B}}[T'] \leq \theta'$. By Lemma 1694, $\tau^{\mathcal{A}}[\gamma^{-1}(T')] \leq \gamma^{-1}(\tau^{\mathcal{B}}[T']) \leq \gamma^{-1}(\theta')$. Finally, $\text{Ker}(\langle H, \gamma \rangle) = \gamma^{-1}(\Delta^{\mathcal{B}}) \leq \gamma^{-1}(\theta')$. So we get

$$\gamma^{-1}(\theta') \in \{\theta \in \text{ConSys}^{\mathbf{K}}(\mathcal{A}) : \text{Ker}(\langle H, \gamma \rangle) \leq \theta \text{ and } \tau^{\mathcal{A}}[\gamma^{-1}(T')] \leq \theta\}. \quad \blacksquare$$

Now, for the main theorem to the effect that $\Psi^{\mathbf{K}, \tau}$ is a semi-coherent family of congruential monotone compatibility $\mathcal{I}$ -operators.

Theorem 1696 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, with a τ^b -algebraic semantics $\mathbf{K}$, such that $\text{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{K}$. $\Psi^{\mathbf{K}, \tau}$ is a semi-coherent family of congruential monotone compatibility $\mathcal{I}$ -operators.*

Proof: Let $\mathcal{A}, \mathcal{B}$ be $\mathbf{F}$ -algebraic systems, $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, with H an isomorphism, and $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$, such that $\langle H, \gamma \rangle$ is $\Psi^{\mathbf{K}, \tau}$ -compatible with $\gamma^{-1}(T')$. Then, by definition,

$$\text{Ker}(\langle H, \gamma \rangle) \leq \Psi^{\mathbf{K}, \tau, \mathcal{A}}(\gamma^{-1}(T')) = \Theta^{\hat{\Pi}(\mathbf{K}), \mathcal{A}}(\tau^{\mathcal{A}}[\gamma^{-1}(T')]).$$

So we have

$$\begin{aligned} \Psi^{\mathbf{K}, \tau, \mathcal{A}}(\gamma^{-1}(T')) &= \Theta^{\hat{\Pi}(\mathbf{K}), \mathcal{A}}(\tau^{\mathcal{A}}[\gamma^{-1}(T')]) \\ &= \bigcap \{ \theta \in \text{ConSys}^{\hat{\Pi}(\mathbf{K})}(\mathcal{A}) : \\ &\quad \text{Ker}(\langle H, \gamma \rangle) \leq \theta \text{ and } \tau^{\mathcal{A}}[\gamma^{-1}(T')] \leq \theta \} \\ &= \bigcap \{ \gamma^{-1}(\theta') : \theta' \in \text{ConSys}^{\hat{\Pi}(\mathbf{K})}(\mathcal{B}) \text{ and } \tau^{\mathcal{B}}[T'] \leq \theta' \} \\ &= \gamma^{-1}(\bigcap \{ \theta' \in \text{ConSys}^{\hat{\Pi}(\mathbf{K})}(\mathcal{B}) : \tau^{\mathcal{B}}[T'] \leq \theta' \}) \\ &= \gamma^{-1}(\Theta^{\hat{\Pi}(\mathbf{K}), \mathcal{B}}(\tau^{\mathcal{B}}[T'])) \\ &= \gamma^{-1}(\Psi^{\mathbf{K}, \tau, \mathcal{B}}(T')). \end{aligned}$$

This proves that $\Psi^{\mathbf{K}, \tau}$ is also semi-coherent (the remaining properties having been demonstrated in Proposition 1693). $\blacksquare$

Since, by Proposition 1685, every family truth equational π -institution $\mathcal{I}$ has $\text{AlgSys}(\mathcal{I})$ as a τ^b -algebraic semantics and $\text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$, setting $\mathbf{K} := \text{AlgSys}(\mathcal{I})$, we get that $\Psi^{\mathbf{K}, \tau}$ is a semi-coherent family of monotone congruential compatibility $\mathcal{I}$ -operators.

Our last result shows that the classes of $\mathbf{F}$ -algebraic systems associated with $\Psi^{K,\tau}$ (which are equal by Proposition 1595) coincide with $\overset{\triangleleft}{\Pi}(\mathbf{K})$.

First, however, we show that, for any π -institution $\mathcal{I}$, with τ^b in N^b , the class $\mathbf{K}(\mathcal{I}, \tau)$ is closed under subdirect intersections.

Lemma 1697 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then*

$$\overset{\triangleleft}{\Pi}(\mathbf{K}(\mathcal{I}, \tau)) \subseteq \mathbf{K}(\mathcal{I}, \tau).$$

Proof: Let $\mathcal{A}^i \in \mathbf{K}(\mathcal{I}, \tau)$, for all $i \in I$, and

$$\langle H^i, \gamma^i \rangle : \mathcal{A} \rightarrow \mathcal{A}^i, \quad i \in I,$$

be a subdirect intersection. Then, we have, by definition of subdirect intersection, $\bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle) = \Delta^{\mathcal{A}}$ and, by Proposition 1683, $\tau^{\mathcal{A}^i}(\Delta^{\mathcal{A}^i}) \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}^i)$, for all $i \in I$. These give

$$\begin{aligned} \tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) &= \tau^{\mathcal{A}}(\bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle)) \\ &= \bigcap_{i \in I} \tau^{\mathcal{A}}(\text{Ker}(\langle H^i, \gamma^i \rangle)) \\ &= \bigcap_{i \in I} \tau^{\mathcal{A}}((\gamma^i)^{-1}(\Delta^{\mathcal{A}^i})) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\tau^{\mathcal{A}^i}(\Delta^{\mathcal{A}^i})) \\ &\in \text{FiFam}^{\mathcal{I}}(\mathcal{A}), \end{aligned}$$

where membership follows from the fact that $\tau^{\mathcal{A}^i}(\Delta^{\mathcal{A}^i}) \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}^i)$, for all $i \in I$, by Corollary 55 and by closure of $\text{FiFam}^{\mathcal{I}}(\mathcal{A})$ under intersections. We conclude, using again Proposition 1683, that $\mathcal{A} \in \mathbf{K}(\mathcal{I}, \tau)$. $\blacksquare$

Recall the classes of $\mathbf{F}$ -algebraic systems

$$\begin{aligned} \text{AlgSys}_{\Psi^{K,\tau}}(\mathcal{I}) &= \{ \mathcal{A} \in \text{AlgSys}(\mathbf{F}) : (\exists T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}))(\Psi^{K,\tau,\mathcal{A}}(T) = \Delta^{\mathcal{A}}) \}; \\ \text{AlgSys}^{\Psi^{K,\tau}}(\mathcal{I}) &= \{ \mathcal{A} / \Psi^{K,\tau,\mathcal{A}}(T) : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}. \end{aligned}$$

Proposition 1698 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, with a τ^b -algebraic semantics $\mathbf{K}$, such that $\text{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{K}$. Then*

$$\text{AlgSys}_{\Psi^{K,\tau}}(\mathcal{I}) = \text{AlgSys}^{\Psi^{K,\tau}}(\mathcal{I}) = \overset{\triangleleft}{\Pi}(\mathbf{K}).$$

Proof: First, by Proposition 1595, $\text{AlgSys}_{\Psi^{K,\tau}}(\mathcal{I}) = \text{AlgSys}^{\Psi^{K,\tau}}(\mathcal{I})$. So it suffices to show that $\text{AlgSys}_{\Psi^{K,\tau}}(\mathcal{I}) = \overset{\triangleleft}{\Pi}(\mathbf{K})$.

Suppose, first, that $\mathcal{A} \in \overset{\triangleleft}{\Pi}(\mathbf{K})$. By Corollary 1684, $\mathbf{K} \subseteq \mathbf{K}(\mathcal{I}, \tau)$. By Lemma 1697, $\overset{\triangleleft}{\Pi}(\mathbf{K}) \subseteq \overset{\triangleleft}{\Pi}(\mathbf{K}(\mathcal{I}, \tau)) \subseteq \mathbf{K}(\mathcal{I}, \tau)$, whence $\mathcal{A} \in \mathbf{K}(\mathcal{I}, \tau)$. Thus, by

Proposition 1683, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Moreover, $\Delta^{\mathcal{A}} \in \text{ConSys}^{\overset{\triangleleft}{\Pi}(\mathbf{K})}(\mathcal{A})$. We now get

$$\Psi^{\mathbf{K}, \tau, \mathcal{A}}(\tau^{\mathcal{A}}(\Delta^{\mathcal{A}})) = \Theta^{\overset{\triangleleft}{\Pi}(\mathbf{K}), \mathcal{A}}(\tau^{\mathcal{A}}[\tau^{\mathcal{A}}(\Delta^{\mathcal{A}})]) \leq \Theta^{\overset{\triangleleft}{\Pi}(\mathbf{K}), \mathcal{A}}(\Delta^{\mathcal{A}}) = \Delta^{\mathcal{A}}.$$

We conclude that $\mathcal{A} \in \text{AlgSys}_{\Psi^{\mathbf{K}, \tau, \mathcal{A}}}(\mathcal{I})$.

Suppose, conversely, that $\mathcal{A} \in \text{AlgSys}_{\Psi^{\mathbf{K}, \tau, \mathcal{A}}}(\mathcal{I})$. Then, there exists $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\Psi^{\mathbf{K}, \tau, \mathcal{A}}(T) = \Delta^{\mathcal{A}}$, that is, $\Theta^{\overset{\triangleleft}{\Pi}(\mathbf{K}), \mathcal{A}}(\tau^{\mathcal{A}}[T]) = \Delta^{\mathcal{A}}$. This shows that $\Delta^{\mathcal{A}}$ is an $\overset{\triangleleft}{\Pi}(\mathbf{K})$ -congruence system on $\mathcal{A}$. Hence $\mathcal{A} \in \overset{\triangleleft}{\Pi}(\mathbf{K})$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, with a τ^b -algebraic semantics $\mathbf{K}$, such that $\text{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{K}$. Then we have

$$\text{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{K} \subseteq \mathbf{K}(\mathcal{I}, \tau).$$

Assume, now, that $\mathcal{I}$ is family truth equational, with witnessing transformations τ^b . By Proposition 1685, $\text{AlgSys}(\mathcal{I})$ is a τ^b -algebraic semantics for $\mathcal{I}$ and, by Proposition 65, $\text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$. Thus, in the case of truth equationality $\mathcal{I}$ has a τ^b -algebraic semantics $\mathbf{K}$, such that $\text{AlgSys}^*(\mathcal{I}) \subseteq \mathbf{K} \subseteq \mathbf{K}(\mathcal{I}, \tau)$.

- If $\mathbf{K} = \text{AlgSys}^*(\mathcal{I})$, then, by Proposition 1674 and Theorem 1441, we would have $\Psi^{\mathbf{K}, \tau} = \widetilde{\Omega}^{\mathcal{I}}$;
- At the other extreme, if $\mathbf{K} = \mathbf{K}(\mathcal{I}, \tau)$, then, we get, by Proposition 1698 and Lemma 1697, a semi-coherent family of congruential monotone compatibility $\mathcal{I}$ -operators $\Psi^{\mathbf{K}, \tau}$, such that, similarly, $\text{AlgSys}_{\Psi^{\mathbf{K}, \tau, \mathcal{A}}}(\mathcal{I}) = \mathbf{K}(\mathcal{I}, \tau)$.

Chapter 22

The Strong Version of a π -Institution

22.1 The Strong Version of a π -Institution

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. We define the following classes of $\mathcal{I}$ -matrix families.

$$\begin{aligned} \mathbf{M}^{\mathcal{I}*} &= \{ \langle \mathcal{A}, T \rangle : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \}; \\ \mathbf{M}^{\mathcal{I}, \text{Su}} &= \{ \langle \mathcal{A}, T \rangle : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \}; \\ \mathbf{M}^{\mathcal{I}, m} &= \{ \langle \mathcal{A}, T \rangle : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}. \end{aligned}$$

We show that all three classes of $\mathcal{I}$ -matrix families generate the same closure system on $\mathbf{F}$.

Proposition 1699 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then $\mathcal{I}^{\mathbf{M}^{\mathcal{I}*}} = \mathcal{I}^{\mathbf{M}^{\mathcal{I}, m}}$.*

Proof: By Lemma 1605, we have that, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$, $\bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$. Thus, $\mathbf{M}^{\mathcal{I}, m} \subseteq \mathbf{M}^{\mathcal{I}*}$. This implies that $\mathcal{I}^{\mathbf{M}^{\mathcal{I}*}} \leq \mathcal{I}^{\mathbf{M}^{\mathcal{I}, m}}$. To show the converse, assume that $\langle \mathcal{A}, T \rangle \in \mathbf{M}^{\mathcal{I}*}$ and consider the quotient morphism $\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\Omega^{\mathcal{A}}(T)$. By Corollary 1591, $\pi(T^*)$ is the least $\mathcal{I}$ -filter family of $\mathcal{A}/\Omega^{\mathcal{A}}(T)$. By hypothesis $T = T^*$, whence $\pi(T) = \pi(T^*)$ and, hence, since $\langle I, \pi \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{A}/\Omega^{\mathcal{A}}(T), \pi(T) \rangle$ is a strict surjective morphism,, we get that

$$\mathcal{I}^{\langle \mathcal{A}, T \rangle} = \mathcal{I}^{\langle \mathcal{A}/\Omega^{\mathcal{A}}(T), \pi(T) \rangle} = \mathcal{I}^{\langle \mathcal{A}/\Omega^{\mathcal{A}}(T), \pi(T^*) \rangle}$$

and $\langle \mathcal{A}/\Omega^{\mathcal{A}}(T), \pi(T^*) \rangle \in \mathbf{M}^{\mathcal{I}, m}$. Putting things together, we finally obtain

$$\begin{aligned} \mathcal{I}^{\mathbf{M}^{\mathcal{I}, m}} &\leq \bigcap \{ \mathcal{I}^{\langle \mathcal{A}/\Omega^{\mathcal{A}}(T), \pi(T^*) \rangle} : T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \} \\ &= \bigcap \{ \mathcal{I}^{\langle \mathcal{A}, T \rangle} : T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \} \\ &= \mathcal{I}^{\mathbf{M}^{\mathcal{I}*}}. \end{aligned}$$

Therefore, $\mathcal{I}^{\mathbf{M}^{\mathcal{I}*}} = \mathcal{I}^{\mathbf{M}^{\mathcal{I}, m}}$. ■

Proposition 1699 enables us to show that $\mathbf{M}^{\mathcal{I}*}$ and $\mathbf{M}^{\mathcal{I}, \text{Su}}$ also generate the same closure system on $\mathbf{F}$.

Corollary 1700 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then $\mathcal{I}^{\mathbf{M}^{\mathcal{I}*}} = \mathcal{I}^{\mathbf{M}^{\mathcal{I}, \text{Su}}}$.*

Proof: By Lemma 1620, $\mathbf{M}^{\mathcal{I}, \text{Su}} \subseteq \mathbf{M}^{\mathcal{I}*}$. Also by Lemma 1620, $\mathbf{M}^{\mathcal{I}, m} \subseteq \mathbf{M}^{\mathcal{I}, \text{Su}}$. So we get $\mathcal{I}^{\mathbf{M}^{\mathcal{I}*}} \leq \mathcal{I}^{\mathbf{M}^{\mathcal{I}, \text{Su}}} \leq \mathcal{I}^{\mathbf{M}^{\mathcal{I}, m}}$. Therefore, by Proposition 1699, $\mathcal{I}^{\mathbf{M}^{\mathcal{I}*}} = \mathcal{I}^{\mathbf{M}^{\mathcal{I}, \text{Su}}}$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Taking into account Proposition 1699 and Corollary 1700, we define the **strong version of $\mathcal{I}$** , denoted by $\mathcal{I}^+ = \langle \mathbf{F}, C^+ \rangle$, by

$$\mathcal{I}^+ := \mathcal{I}^{\mathbf{M}^{\mathcal{I}*}} = \mathcal{I}^{\mathbf{M}^{\mathcal{I}, \text{Su}}} = \mathcal{I}^{\mathbf{M}^{\mathcal{I}, m}}.$$

There are even more ways to characterize the π -institution $\mathcal{I}^+$. Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Given a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems, we define

$$\begin{aligned} \mathbf{M}_{\mathbf{K}}^{\mathcal{I},m} &= \{ \langle \mathcal{A}, T \rangle : \mathcal{A} \in \mathbf{K}, T = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}; \\ \mathbf{M}_{\mathbf{K}}^{\mathcal{I}*} &= \{ \langle \mathcal{A}, T \rangle : \mathcal{A} \in \mathbf{K}, T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \}; \\ \mathbf{M}_{\mathbf{K}}^{\mathcal{I},\text{Su}} &= \{ \langle \mathcal{A}, T \rangle : \mathcal{A} \in \mathbf{K}, T \in \text{FiFam}^{\mathcal{I},\text{Su}}(\mathcal{A}) \}. \end{aligned}$$

Proposition 1701 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$ and $\mathbf{K} = \text{AlgSys}^*(\mathcal{I})$ or $\mathbf{K} = \text{AlgSys}(\mathcal{I})$. Then*

$$\mathcal{I}^+ = \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I},m}} = \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I}*}} = \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I},\text{Su}}}.$$

Proof: By definition and Lemma 1620, we have

$$\mathbf{M}_{\mathbf{K}}^{\mathcal{I},m} \subseteq \mathbf{M}_{\mathbf{K}}^{\mathcal{I},\text{Su}} \subseteq \mathbf{M}_{\mathbf{K}}^{\mathcal{I}*} \subseteq \mathbf{M}^{\mathcal{I}*}.$$

Therefore, we get

$$\mathcal{I}^+ \leq \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I}*}} \leq \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I},\text{Su}}} \leq \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I},m}}.$$

For the converse, suppose $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$ and $T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$. By Proposition 1609, $T/\Omega^{\mathcal{A}}(T)$ is the least $\mathcal{I}$ -filter family of $\mathcal{A}/\Omega^{\mathcal{A}}(T) \in \text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$. Therefore, we get

$$\begin{aligned} \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I},m}} &\leq \bigcap \{ \mathcal{I}^{\langle \mathcal{A}/\Omega^{\mathcal{A}}(T), T/\Omega^{\mathcal{A}}(T) \rangle} : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \} \\ &= \bigcap \{ \mathcal{I}^{\langle \mathcal{A}, T \rangle} : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \} \\ &= \mathcal{I}^+. \end{aligned}$$

We conclude that $\mathcal{I}^+ = \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I},m}} = \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I}*}} = \mathcal{I}^{\mathbf{M}_{\mathbf{K}}^{\mathcal{I},\text{Su}}}$. ■

The following proposition lists some of the properties of the strong version $\mathcal{I}^+$ of a π -institution $\mathcal{I}$.

Proposition 1702 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.*

- (a) $\mathcal{I} \leq \mathcal{I}^+$;
- (b) $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$;
- (c) $\text{FiFam}^{\mathcal{I},\text{Su}}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}*}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$;
- (d) If $\mathcal{I}$ is family reflective, then $\mathcal{I}^+ = \mathcal{I}$.

Proof:

- (a) Since $\mathbf{M}^{\mathcal{I},m} \subseteq \text{MatFam}(\mathcal{I})$, we get $\mathcal{I} = \mathcal{I}^{\text{MatFam}(\mathcal{I})} \leq \mathcal{I}^{\mathbf{M}^{\mathcal{I},m}} = \mathcal{I}^+$.

- (b) Since, by Part (a), $\mathcal{I} \leq \mathcal{I}^+$, we get that $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$.
- (c) By definition of $\mathcal{I}^+$, we have, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$, all $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$ and all $T' \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, $C^+ \leq C^{\langle \mathcal{A}, T \rangle}$ and $C^+ \leq C^{\langle \mathcal{A}, T' \rangle}$. Moreover, by Lemma 1620, every Suszko filter family is a Leibniz filter family. We conclude that $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$.
- (d) By the hypothesis and Proposition 1610, $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$. Therefore, $\mathcal{I}^+ = \mathcal{I}^{\text{M}^{\mathcal{I}^*}} = \mathcal{I}^{\text{MatFam}(\mathcal{I})} = \mathcal{I}$. ■

It turns out that the strong version $\mathcal{I}^+$ is mostly interesting when $\mathcal{I}$ itself has theorems. In the absence of theorems $\mathcal{I}^+$ has only trivial theory families.

Proposition 1703 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ does not have theorems, then $\mathcal{I}$ is almost inconsistent.*

Proof: Assume that $\mathcal{I}$ does not have theorems. Then, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\emptyset \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Therefore, by definition $\mathcal{I}^+ = \bigcap \{ \mathcal{I}^{\langle \mathcal{A}, \emptyset \rangle} : \mathcal{A} \in \text{AlgSys}(\mathbf{F}) \}$. This implies that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$, we have, vacuously, for all $\psi \in \text{SEN}^b(\Sigma)$, $\psi \in C_{\Sigma}^+(\phi)$. Therefore, the only Σ -theory families of $\mathcal{I}^+$ are $\emptyset$ and $\text{SEN}^b(\Sigma)$. So $\mathcal{I}^+$ is almost inconsistent. ■

The least $\mathcal{I}$ -filter family on every algebraic system $\mathcal{A}$ coincides with the least $\mathcal{I}^+$ -filter family. As a consequence $\mathcal{I}$ and $\mathcal{I}^+$ share the same theorems.

Lemma 1704 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$,*

$$\bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \bigcap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}).$$

In particular, $\text{ThFam}(\mathcal{I}^+) = \text{ThFam}(\mathcal{I})$.

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system. By Proposition 1702, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Thus, we have $\bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \leq \bigcap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. On the other hand, by Lemma 1605, $\bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, whence, by Proposition 1702, $\bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Therefore, $\bigcap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \leq \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Equality now follows. ■

Lemma 1704 implies the idempotency of the strong version operator on π -institutions.

Corollary 1705 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then $(\mathcal{I}^+)^+ = \mathcal{I}^+$.*

Proof: We have

$$\begin{aligned} (\mathcal{I}^+)^+ &= \bigcap \{ \mathcal{I}^{\langle \mathcal{A}, T \rangle} : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T = \bigcap \text{FiFam}^{\mathcal{I}^+}(\mathcal{I}) \} \\ &= \bigcap \{ \mathcal{I}^{\langle \mathcal{A}, T \rangle} : \mathcal{A} \in \text{AlgSys}(\mathbf{F}), T = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{I}) \} \\ &= \mathcal{I}^+. \end{aligned}$$

The first and last equalities follow by the definition of $^+$, and the main equality is due to Lemma 1704. ■

The next proposition provides sufficient conditions for recognizing that a given π -institution is the strong version of another π -institution based on the same algebraic system.

Proposition 1706 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$, $\mathcal{I}' = \langle \mathbf{F}, C' \rangle$ π -institutions based on $\mathbf{F}$, such that*

1. $\mathcal{I}'$ is family reflective;
2. $\text{AlgSys}(\mathcal{I}') = \text{AlgSys}(\mathcal{I})$;
3. For all $\mathcal{A} \in \text{AlgSys}(\mathcal{I}')$, $\bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \bigcap \text{FiFam}^{\mathcal{I}'}(\mathcal{A})$.

Then $\mathcal{I}' = \mathcal{I}^+$.

Proof: We have

$$\begin{aligned} \mathcal{I}' &= \mathcal{I}'^+ \quad (\text{by 1 and Proposition 1702}) \\ &= \bigcap \{ \mathcal{I}^{\langle \mathcal{A}, T \rangle} : \mathcal{A} \in \text{AlgSys}(\mathcal{I}'), T = \bigcap \text{FiFam}^{\mathcal{I}'}(\mathcal{A}) \} \\ &\quad (\text{by Proposition 1701}) \\ &= \bigcap \{ \mathcal{I}^{\langle \mathcal{A}, T \rangle} : \mathcal{A} \in \text{AlgSys}(\mathcal{I}), T = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \} \\ &\quad (\text{by 2 and 3}) \\ &= \mathcal{I}^+. \quad (\text{by Proposition 1701}) \end{aligned}$$

This proves the claim. ■

We now show that Suszko and Leibniz $\mathcal{I}$ -filter families form subclasses, respectively, of the classes of Suszko and Leibniz $\mathcal{I}^+$ -filter families on every $\mathbf{F}$ -algebraic system.

Proposition 1707 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$,*

$$\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A}) \quad \text{and} \quad \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^{+*}}(\mathcal{A}).$$

Proof: By Proposition 1702, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Thus, for all $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, $\llbracket T \rrbracket^{\mathcal{I}^{+*}} \subseteq \llbracket T \rrbracket^{\mathcal{I}^*}$ and $\llbracket T \rrbracket^{\mathcal{I}^+, \text{Su}} \subseteq \llbracket T \rrbracket^{\mathcal{I}, \text{Su}}$.

Suppose that $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Then, by Proposition 1702, $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$ and, moreover, $T = \bigcap \llbracket T \rrbracket^{\mathcal{I}, \text{Su}} \leq \bigcap \llbracket T \rrbracket^{\mathcal{I}^+, \text{Su}}$. Thus, since $T \in \llbracket T \rrbracket^{\mathcal{I}^+, \text{Su}}$, we get that $T = \bigcap \llbracket T \rrbracket^{\mathcal{I}^+, \text{Su}} \in \text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A})$.

The second inclusion may be shown similarly. ■

But the Leibniz counterpart of an $\mathcal{I}^+$ -filter family is identical whether it be considered with respect to $\mathcal{I}$ or with respect to $\mathcal{I}^+$.

Lemma 1708 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, and all $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, $T^{\mathcal{I}^*} = T^{\mathcal{I}^{+*}}$.*

Proof: By Proposition 1702, $\llbracket T \rrbracket^{\mathcal{I}^{+*}} \subseteq \llbracket T \rrbracket^{\mathcal{I}^*}$. Therefore, $T^{\mathcal{I}^*} \leq T^{\mathcal{I}^{+*}}$. On the other hand,

$$\begin{aligned} T^{\mathcal{I}^*} &\in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \quad (\text{by Proposition 1607}) \\ &\subseteq \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \quad (\text{by Proposition 1707}) \end{aligned}$$

and, since $T^{\mathcal{I}^*} \in \llbracket T \rrbracket^{\mathcal{I}^*}$, $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^{\mathcal{I}^*})$. Thus, $T^{\mathcal{I}^*} \subseteq \llbracket T \rrbracket^{\mathcal{I}^{+*}}$, which gives $T^{\mathcal{I}^{+*}} \leq T^{\mathcal{I}^*}$. We conclude that $T^{\mathcal{I}^*} = T^{\mathcal{I}^{+*}}$. ■

And this implies that the Leibniz $\mathcal{I}$ -filter families and the Leibniz $\mathcal{I}^+$ -filter families coincide on every $\mathbf{F}$ -algebraic system.

Corollary 1709 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$,*

$$\text{FiFam}^{\mathcal{I}^{+*}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}).$$

Proof: The right-to-left inclusion was shown in Proposition 1707. For the reverse, assume that $T \in \text{FiFam}^{\mathcal{I}^{+*}}(\mathcal{A})$. Then, by Proposition 1702, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and, by Lemma 1708, $T = T^{\mathcal{I}^{+*}} = T^{\mathcal{I}^*}$. Therefore, $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. ■

22.2 Leibniz and Suszko $\mathcal{I}^+$ -Filter Families

There is a relation between the $\mathcal{I}^+$ -filter families on algebraic systems and the Leibniz and Suszko $\mathcal{I}$ -filter families on the same algebraic systems. The following proposition shows how these relations interplay with family c-reflectivity.

Proposition 1710 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.*

- (a) *If, for all $\mathbf{F}$ -algebraic systems $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, then $\mathcal{I}^+$ is family c-reflective.*
- (b) *If $\mathcal{I}^+$ is family c-reflective, then $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, for all $\mathbf{F}$ -algebraic systems $\mathcal{A}$.*

Proof:

- (a) Suppose, for all $\mathbf{F}$ -algebraic systems $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system. By Proposition 1707, $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A})$. Hence, by hypothesis, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A})$. Thus, $\text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. By Theorem 1627, $\mathcal{I}^+$ is family c-reflective.
- (b) Suppose $\mathcal{I}^+$ is family c-reflective and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system. By Theorem 1627, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A})$. Since, by Lemma 1620 and Corollary 1709, $\text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^+*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, we get that $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. The reverse inclusion holds by Proposition 1702. ■

A necessary and sufficient condition for the $\mathcal{I}^+$ -filter families to coincide with the Leibniz $\mathcal{I}$ -filter families is the universal reflectivity of the Leibniz operator on $\mathcal{I}^+$ -filter families.

Proposition 1711 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$,*

$$\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$$

if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Omega^{\mathcal{A}}$ is order reflecting on $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$.

Proof: By Corollary 1709, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^+*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. By Proposition 1610, $\Omega^{\mathcal{A}}$ is reflective on $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, for all $\mathcal{A}$, if and only if $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^+*}(\mathcal{A})$, for all $\mathcal{A}$. Thus, we get that $\Omega^{\mathcal{A}}$ is reflective on $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, for all $\mathcal{A}$, if and only if $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, for all $\mathcal{A}$. ■

Under the stipulation that the strong version of $\mathcal{I}$ be protoalgebraic, the identification of $\mathcal{I}^+$ -filter families with the Leibniz $\mathcal{I}$ -families have several characterizations.

Proposition 1712 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, such that $\mathcal{I}^+$ is protoalgebraic. The following conditions are equivalent:*

- (i) $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$;
- (ii) $\text{ThFam}(\mathcal{I}^+) = \text{ThFam}^*(\mathcal{I})$;
- (iii) $\mathcal{I}^+$ is weakly family algebraizable;
- (iv) $\mathcal{I}^+$ is family c-reflective;

Proof:

- (i) $\Rightarrow$ (ii) Trivial.
- (ii) $\Rightarrow$ (iii) Suppose that $\text{ThFam}(\mathcal{I}^+) = \text{ThFam}^*(\mathcal{I})$. By Proposition 1565, Ω is injective on $\text{ThFam}^*(\mathcal{I})$. By definition it is onto $\text{FiFam}^{\mathcal{I}^*}(\mathcal{F})$. Thus, by hypothesis and Corollary 1709, $\Omega : \text{FiFam}(\mathcal{I}^+) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{F})$ is a bijection. By hypothesis it is monotone and, by Proposition 1565, it is order reflecting. Therefore, it is an order isomorphism. By Theorem 296, $\mathcal{I}^+$ is weakly family algebraizable.
- (iii) $\Rightarrow$ (iv) Every weakly family algebraizable π -institution is a fortiori family c-reflective.
- (iv) $\Rightarrow$ (i) By hypothesis, $\mathcal{I}^+$ is protoalgebraic, whence, by Proposition 1638 and Corollary 1709,

$$\text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}).$$

By hypothesis and Theorem 1627, $\text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Therefore, we get that $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. ■

We close the section by looking at various consequences of the condition imposed on a π -institution $\mathcal{I}$ that $\Omega^{\mathcal{A}}$ be an order isomorphism from the Leibniz $\mathcal{I}$ -filter families of $\mathcal{A}$ onto the $\mathcal{I}^*$ -congruence systems on $\mathcal{A}$, for every $\mathcal{I}$ -algebraic system $\mathcal{A}$. First, we show that this condition ensures that $\mathcal{I}$ -algebraic systems, $\mathcal{I}^*$ -algebraic systems, $\mathcal{I}^+$ -algebraic systems and $(\mathcal{I}^+)^*$ -algebraic systems all coincide.

Lemma 1713 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathcal{I}$, such that, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,*

$$\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{AlgSys}^{\mathcal{I}^*}(\mathcal{A})$$

is an order isomorphism. Then

$$\text{AlgSys}(\mathcal{I}^+) = \text{AlgSys}^*(\mathcal{I}^+) = \text{AlgSys}^*(\mathcal{I}) = \text{AlgSys}(\mathcal{I}).$$

Proof: We show, first, that $\text{AlgSys}^*(\mathcal{I}^+) = \text{AlgSys}^*(\mathcal{I})$. The left-to-right inclusion holds because, by Proposition 1702, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{I}$. Assume, conversely, that $\mathcal{A} \in \text{AlgSys}^*(\mathcal{I})$. Then $\Delta^{\mathcal{A}} \in \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$. By hypothesis, then, there exists $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, such that $\Omega^{\mathcal{A}}(T) = \Delta^{\mathcal{A}}$. By Proposition 1702 again, $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Hence, $\mathcal{A} \in \text{AlgSys}^*(\mathcal{I}^+)$.

Now we have

$$\begin{aligned} \text{AlgSys}(\mathcal{I}) &= \text{AlgSys}^*(\mathcal{I}) && \text{(by Lemma 1660)} \\ &= \text{AlgSys}^*(\mathcal{I}^+) && \text{(shown above)} \\ &\subseteq \text{AlgSys}(\mathcal{I}^+) && \text{(by Proposition 65)} \\ &\subseteq \text{AlgSys}(\mathcal{I}). && \text{(by Proposition 1702).} \end{aligned}$$

We conclude that all four classes of algebraic system coincide. $\blacksquare$

Next we show that, under the same hypothesis the Leibniz congruence systems of a filter family and its Leibniz counterpart coincide and that the Suszko congruence system of a filter family coincides with the Leibniz congruence system of its Suszko counterpart.

Proposition 1714 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathcal{I}$, such that, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,*

$$\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{AlgSys}^{\mathcal{I}^*}(\mathcal{A})$$

is an order isomorphism. Then, for every $\mathbf{F}$ -algebraic system and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,

$$\Omega^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(T^*) \quad \text{and} \quad \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Omega^{\mathcal{A}}(T^{\mathcal{I}, \text{Su}}).$$

Proof: By Proposition 1659, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism.

Let $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Since $\Omega^{\mathcal{A}}(T) \in \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$, there exists $T' \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, such that $\Omega^{\mathcal{A}}(T') = \Omega^{\mathcal{A}}(T)$. Hence, $\llbracket T \rrbracket^* = \llbracket T' \rrbracket^*$, which gives $T^* = T'^* = T'$. Thus, we get $\Omega^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(T') = \Omega^{\mathcal{A}}(T^*)$.

By hypothesis and Lemma 1660, $\text{AlgSys}^*(\mathcal{I}) = \text{AlgSys}(\mathcal{I})$. Since we have $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \text{ConSys}^{\mathcal{I}}(\mathcal{A})$, there exists $T'' \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, such that $\Omega^{\mathcal{A}}(T'') = \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)$. Thus, we get $\llbracket T \rrbracket^{\text{Su}} = \llbracket T'' \rrbracket^*$ and, therefore, $T^{\mathcal{I}, \text{Su}} = T''^* = T''$. This gives $\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Omega^{\mathcal{A}}(T'') = \Omega^{\mathcal{A}}(T^{\mathcal{I}, \text{Su}})$. $\blacksquare$

Under the same hypothesis, it turns out that the coincidence of the class of Leibniz filter families with Suszko filter families on every algebraic system characterizes protoalgebraicity.

Corollary 1715 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathcal{I}$, such that, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,*

$$\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{AlgSys}^{\mathcal{I}^*}(\mathcal{A})$$

is an order isomorphism. $\mathcal{I}$ is protoalgebraic if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$.

Proof: If $\mathcal{I}$ is protoalgebraic, then, by Proposition 1638, Leibniz and Suszko classes coincide and, therefore, $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$.

Suppose, conversely, that, for all $\mathbf{F}$ -algebraic systems $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Let $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By Lemma 1620, $T^{\mathcal{I}, \text{Su}} \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. By the hypothesis and Lemma 1623, $T^{\mathcal{I}, \text{Su}}$ is the largest Leibniz $\mathcal{I}$ -filter family included in T . Since, by Lemma

1620, $T^{\mathcal{I}, \text{Su}} \leq T^* \leq T$ and, by Proposition 1607, T^* is a Leibniz $\mathcal{I}$ -filter family, we get $T^{\mathcal{I}, \text{Su}} = T^*$. Therefore, using Proposition 1607, we get

$$\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) = \Omega^{\mathcal{A}}(T^{\mathcal{I}, \text{Su}}) = \Omega^{\mathcal{A}}(T^*) = \Omega^{\mathcal{A}}(T).$$

Thus, on every $\mathbf{F}$ -algebraic system $\mathcal{A}$, the Suszko and the Leibniz operators coincide and, therefore, by Lemma 1555, $\mathcal{I}$ is protoalgebraic. ■

We already have the tools to show that the property that $\Omega^{\mathcal{A}}$ be an isomorphism between Leibniz filter families and reduced algebraic systems is bequeathed by a π -institution $\mathcal{I}$ to its strong version $\mathcal{I}^+$.

Lemma 1716 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathcal{I}$, such that, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,*

$$\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{AlgSys}^{\mathcal{I}^*}(\mathcal{A})$$

is an order isomorphism. Then, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I}^+)$, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^{++}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^{++}}(\mathcal{A})$ is also an order isomorphism.

Proof: By Corollary 1709, we have $\text{FiFam}^{\mathcal{I}^{++}}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. By Lemma 1713, $\text{AlgSys}^*(\mathcal{I}) = \text{AlgSys}^*(\mathcal{I}^+)$. Now, taking into account the hypothesis, we get the conclusion. ■

In a proposition analogous to Proposition 1712, we provide under our working hypothesis, of the Leibniz operator being an order isomorphism, a characterization of the property of $\mathcal{I}^+$ being weakly family algebraizable.

Proposition 1717 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathcal{I}$, such that, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,*

$$\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{AlgSys}^{\mathcal{I}^*}(\mathcal{A})$$

is an order isomorphism. The following conditions are equivalent:

- (i) $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$;
- (ii) $\text{ThFam}(\mathcal{I}^+) = \text{ThFam}^*(\mathcal{I})$;
- (iii) $\mathcal{I}^+$ is weakly family algebraizable;
- (iv) $\mathcal{I}^+$ is family c -reflective;
- (v) Ω is injective on the collection of reduced $\mathcal{I}^+$ -filter families.

Proof:

(i) $\Rightarrow$ (ii) Trivial.

- (ii) $\Rightarrow$ (iii) By hypothesis and Lemma 1713, $\Omega : \text{ThFam}(\mathcal{I}^+) \rightarrow \text{ConSys}^{\mathcal{I}^+}(\mathcal{F})$ is an order isomorphism. Thus Ω is both monotone and family c-reflective, whence $\mathcal{I}^+$ is weakly family algebraizable.
- (iii) $\Rightarrow$ (iv) Weak family algebraizability implies family c-reflectivity.
- (iv) $\Rightarrow$ (v) If $\mathcal{I}^+$ is family c-reflective, then it is a fortiori injective. Therefore, by Theorem 214, $\Omega^{\mathcal{A}}$ is injective on the $\mathcal{I}$ -filter families of every $\mathbf{F}$ -algebraic system $\mathcal{A}$.
- (v) $\Rightarrow$ (i) Suppose (v) holds and let $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$. By Proposition 1702, we have $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. So it suffices to prove the reverse inclusion. To this end, suppose $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\Omega^{\mathcal{A}}(T).$$

$\text{Ker}(\langle I, \pi \rangle) = \Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^*)$, the last inclusion, since, by Proposition 1562, $T^* \in \llbracket T \rrbracket^{\mathcal{I}^*}$. Hence, by Corollary 56,

$$\pi(T), \pi(T^*) \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}/\Omega^{\mathcal{A}}(T))$$

and, by compatibility, $\pi^{-1}(\pi(T)) = T$ and $\pi^{-1}(\pi(T^*)) = T^*$. By Corollary 1591, $\pi(T^*) = \pi(T)^*$. Now we get

$$\begin{aligned} \Delta^{\mathcal{A}/\Omega^{\mathcal{A}}(T)} &= \Omega^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\pi(T)) \quad (\text{by Lemma 1594}) \\ &= \Omega^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\pi(T)^*) \quad (\text{by Proposition 1714}) \\ &= \Omega^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\pi(T^*)). \end{aligned}$$

This, both $\pi(T)$ and $\pi(T^*)$ are reduced $\mathcal{I}^+$ -filter families and, therefore, by the injectivity hypothesis, $\pi(T) = \pi(T^*)$. Now we conclude that $T = \pi^{-1}(\pi(T)) = \pi^{-1}(\pi(T^*)) = T^*$. This proves that, for all $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. Equality now follows. $\blacksquare$

22.3 Full $\mathcal{I}^+$ -Structures

We now explore the relation between full $\mathcal{I}$ -structures and full $\mathcal{I}^+$ -structures.

Proposition 1718 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $\mathcal{A}$ an $\mathbf{F}$ -algebraic system. $\langle \mathcal{A}, \mathcal{D} \rangle \in \text{FStr}^{\mathcal{I}^+}(\mathcal{A})$ if and only if, there exists $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}^{\mathcal{I}}(\mathcal{A})$ and $\mathcal{D} = \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, i.e.,*

$$\text{FStr}(\mathcal{I}^+) = \{ \langle \mathcal{A}, \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \rangle : \langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I}) \}.$$

Proof:

($\Rightarrow$) Suppose that $\langle \mathcal{A}, \mathcal{D} \rangle \in \text{FStr}(\mathcal{I}^+)$. Set

$$\mathcal{T} = \{T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) \leq \Omega^{\mathcal{A}}(T)\}.$$

If $T \in \mathcal{D}$, then $\tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) \leq \Omega^{\mathcal{A}}(T)$ and $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}}(T)$. Thus, $T \in \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. On the other hand, let $T \in \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Then $\tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) \leq \Omega^{\mathcal{A}}(T)$ and, since $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$ and $\langle \mathcal{A}, \mathcal{D} \rangle \in \text{FStr}(\mathcal{I}^+)$, we must have, by Theorem 1432, $T \in \mathcal{D}$. We conclude that $\mathcal{D} = \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Thus, it only remains to show that $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$.

To this end, let $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \leq \Omega^{\mathcal{A}}(T)$. Then, we get $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \leq \bigcap_{T' \in \mathcal{D}} \Omega^{\mathcal{A}}(T') = \tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) \leq \Omega^{\mathcal{A}}(T)$. Thus, by definition, $T \in \mathcal{T}$. We conclude, using Theorem 1432, that $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$.

($\Leftarrow$) Suppose, now, that $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$ and $\mathcal{D} = \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Since, by Proposition 1600, the least element of a full $\mathcal{I}$ -structure is a Leibniz $\mathcal{I}$ -filter family, we get that $\bigcap \mathcal{T} \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. To see that $\langle \mathcal{A}, \mathcal{D} \rangle$ is a dull $\mathcal{I}^+$ -structure, let $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) \leq \Omega^{\mathcal{A}}(T)$. Then, we infer

$$\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \leq \tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) \leq \Omega^{\mathcal{A}}(T).$$

Since $\langle \mathcal{A}, \mathcal{T} \rangle \in \text{FStr}(\mathcal{I})$, then, by Theorem 1432, $T \in \mathcal{T}$. Since, in addition, by hypothesis, $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, we get $T \in \mathcal{D}$. Thus, again by Theorem 1432, $\langle \mathcal{A}, \mathcal{D} \rangle \in \text{FStr}(\mathcal{I}^+)$. ■

Next, we show that the association

$$\langle \mathcal{A}, \mathcal{T} \rangle \mapsto \langle \mathcal{A}, \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \rangle$$

of full $\mathcal{I}^+$ -structures to full $\mathcal{I}$ -structures, given in Proposition 1718, is one-to-one, provided that $\mathcal{I}$ - and $\mathcal{I}^+$ -algebraic systems coincide.

Proposition 1719 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, such that $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}(\mathcal{I}^+)$, and $\mathcal{A}$ an $\mathbf{F}$ -algebraic system. For all $\langle \mathcal{A}, \mathcal{T} \rangle, \langle \mathcal{A}, \mathcal{T}' \rangle \in \text{FStr}(\mathcal{I})$,*

$$\mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \mathcal{T}' \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \quad \text{implies} \quad \mathcal{T} = \mathcal{T}'.$$

Proof: We start with some preparatory remarks. Suppose $\mathcal{A}$ is an $\mathbf{F}$ -algebraic system. Since, by hypothesis, $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}(\mathcal{I}^+)$, we get that $\text{ConSys}^{\mathcal{I}}(\mathcal{A}) = \text{ConSys}^{\mathcal{I}^+}(\mathcal{A})$. Now, using Theorem 1445 (or, alternatively, Corollary 1602), we have that $\mathbf{FStr}^{\mathcal{I}}(\mathcal{A}) \cong \mathbf{FStr}^{\mathcal{I}^+}(\mathcal{A})$, through

$$\mathcal{T} \mapsto \overline{\mathcal{T}} = \{T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \leq \Omega^{\mathcal{A}}(T)\}.$$

This is obtained, by applying Theorem 1445 to get an isomorphism

$$\begin{aligned} \gamma : \text{FiFam}^{\mathcal{I}}(\mathcal{A}) &\rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{A}); \\ \mathcal{T} &\xrightarrow{\gamma} \tilde{\Omega}^{\mathcal{A}}(\mathcal{T}), \end{aligned}$$

then, applying Theorem 1445 to get an isomorphism

$$\begin{aligned} \delta : \text{ConSys}^{\mathcal{I}^+}(\mathcal{A}) &\rightarrow \text{FStr}^{\mathcal{I}^+}(\mathcal{A}); \\ \theta &\xrightarrow{\delta} \{T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) : \theta \leq \Omega^{\mathcal{A}}(T)\} \end{aligned}$$

and, finally, composing these two, taking into account the hypothesis.

Now let $\mathcal{T}, \mathcal{T}' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathcal{T} \rangle, \langle \mathcal{A}, \mathcal{T}' \rangle \in \text{FStr}^{\mathcal{I}}(\mathcal{A})$, and suppose that $\mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \mathcal{T}' \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$.

Claim 1: $\overline{\mathcal{T}} = \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$ and $\overline{\mathcal{T}'} = \mathcal{T}' \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$.

We show the first equality. The second one is shown in exactly the same way. First, if $T \in \overline{\mathcal{T}}$, then $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$ and $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \leq \Omega^{\mathcal{A}}(T)$. Since $\langle \mathcal{A}, \mathcal{T} \rangle$ is a full $\mathcal{I}$ -structure, by Theorem 1432, $T \in \mathcal{T}$. Thus, $T \in \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. If, on the other hand, $T \in \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, then $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$ and $T \in \mathcal{T}$. Thus, $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$ and $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) \leq \Omega^{\mathcal{A}}(T)$. Therefore, $T \in \overline{\mathcal{T}}$.

Claim 2: $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \tilde{\Omega}^{\mathcal{A}}(\overline{\mathcal{T}})$ and $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}') = \tilde{\Omega}^{\mathcal{A}}(\overline{\mathcal{T}'})$.

Again, it suffices to show the first equality, since the second is proven in exactly the same way. By Claim 1 and Proposition 1718, $\langle \mathcal{A}, \overline{\mathcal{T}} \rangle \in \text{FStr}^{\mathcal{I}^+}(\mathcal{A})$. Therefore, by Theorem 1432, $\overline{\mathcal{T}} = \{T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{A}}(\overline{\mathcal{T}}) \leq \Omega^{\mathcal{A}}(T)\}$. Thus, we get $\delta(\tilde{\Omega}^{\mathcal{A}}(\mathcal{T})) = \delta(\gamma(\mathcal{T})) = \overline{\mathcal{T}} = \delta(\tilde{\Omega}^{\mathcal{A}}(\overline{\mathcal{T}}))$. Since δ is an isomorphism, we get that $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \tilde{\Omega}^{\mathcal{A}}(\overline{\mathcal{T}})$.

To finish the proof, we get $\tilde{\Omega}^{\mathcal{A}}(\mathcal{T}) = \tilde{\Omega}^{\mathcal{A}}(\overline{\mathcal{T}}) = \tilde{\Omega}^{\mathcal{A}}(\overline{\mathcal{T}'}) = \tilde{\Omega}^{\mathcal{A}}(\mathcal{T}')$. Therefore, by Theorem 1445, $\mathcal{T} = \mathcal{T}'$. ■

Now we can formulate an order isomorphism between full $\mathcal{I}$ - and full $\mathcal{I}^+$ -structures, subject to the condition that $\mathcal{I}$ - and $\mathcal{I}^+$ -algebraic systems coincide.

Corollary 1720 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, such that $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}(\mathcal{I}^+)$, and $\mathcal{A}$ an $\mathbf{F}$ -algebraic system.*

$$\begin{aligned} h : \text{FStr}^{\mathcal{I}}(\mathcal{A}) &\rightarrow \text{FStr}^{\mathcal{I}^+}(\mathcal{A}); \\ \langle \mathcal{A}, \mathcal{T} \rangle &\xrightarrow{h} \langle \mathcal{A}, \mathcal{T} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \rangle \end{aligned}$$

is an order isomorphism.

Proof: By Propositions 1718 and 1719. ■

We turn next to relationships between full classes of filter families with respect to a π -institution $\mathcal{I}$ and its strong version $\mathcal{I}^+$. Recall that, given any

$\mathcal{A} \in \text{AlgSys}(\mathbf{F})$, we have $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. So we get immediately the following inclusions, for all $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$.

$$\begin{aligned} \llbracket T \rrbracket^{\mathcal{I}^+*} &= \{T' \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) : \Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\} \\ &\subseteq \{T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\} \\ &= \llbracket T \rrbracket^{\mathcal{I}*}. \end{aligned}$$

Moreover, taking into account

$$\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) = \tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T) \leq \tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}^+}(\mathcal{A})^T) = \tilde{\Omega}^{\mathcal{I}^+,\mathcal{A}}(T),$$

we infer

$$\begin{aligned} \llbracket T \rrbracket^{\mathcal{I}^+,\text{Su}} &= \{T' \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{I}^+,\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\} \\ &\subseteq \{T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\} \\ &= \llbracket T \rrbracket^{\mathcal{I},\text{Su}}. \end{aligned}$$

These relationships may be strengthened to apply to all extensions to a π -institution rather than only its strong version. More precisely, we obtain

Lemma 1721 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ and $\mathcal{I}' = \langle \mathbf{F}, C' \rangle$ be π -institutions based on $\mathbf{F}$, such that $\mathcal{I} \leq \mathcal{I}'$, $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}'}(\mathcal{A})$. Then*

$$\llbracket T \rrbracket^{\mathcal{I}'*} = \llbracket T \rrbracket^{\mathcal{I}*} \cap \text{FiFam}^{\mathcal{I}'}(\mathcal{A}) \quad \text{and} \quad \llbracket T \rrbracket^{\mathcal{I}',\text{Su}} \subseteq \llbracket T \rrbracket^{\mathcal{I},\text{Su}} \cap \text{FiFam}^{\mathcal{I}'}(\mathcal{A}).$$

Proof: We have, mimicking the process preceding the statement, applied to the extension $\mathcal{I}'$ rather than specifically $\mathcal{I}^+$:

$$\begin{aligned} \llbracket T \rrbracket^{\mathcal{I}'*} &= \{T' \in \text{FiFam}^{\mathcal{I}'}(\mathcal{A}) : \Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\} \\ &= \{T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\} \cap \text{FiFam}^{\mathcal{I}'}(\mathcal{A}) \\ &= \llbracket T \rrbracket^{\mathcal{I}*} \cap \text{FiFam}^{\mathcal{I}'}(\mathcal{A}). \end{aligned}$$

Moreover, taking into account

$$\tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) = \tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})^T) \leq \tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}'}(\mathcal{A})^T) = \tilde{\Omega}^{\mathcal{I}',\mathcal{A}}(T),$$

we infer

$$\begin{aligned} \llbracket T \rrbracket^{\mathcal{I}',\text{Su}} &= \{T' \in \text{FiFam}^{\mathcal{I}'}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{I}',\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\} \\ &\subseteq \{T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) : \tilde{\Omega}^{\mathcal{I},\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')\} \cap \text{FiFam}^{\mathcal{I}'}(\mathcal{A}) \\ &= \llbracket T \rrbracket^{\mathcal{I},\text{Su}} \cap \text{FiFam}^{\mathcal{I}'}(\mathcal{A}). \end{aligned}$$

Thus, we have the equality and the inclusion claimed. ■

Since $\mathcal{I}^+$ is an extension of $\mathcal{I}$, then we immediately deduce

Corollary 1722 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A}$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Then*

$$[T]^{\mathcal{I}^+} = [T]^{\mathcal{I}^+} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \quad \text{and} \quad [T]^{\mathcal{I}^+, \text{Su}} \subseteq [T]^{\mathcal{I}, \text{Su}} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}).$$

Proof: By Lemma 1721, since $\mathcal{I} \leq \mathcal{I}^+$. ■

Finally, we strengthen the preceding relation between Suszko classes to an equality, in the special case, where T happens to be a Suszko $\mathcal{I}$ -filter family of $\mathcal{I}$ (recalling that $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{I}) \subseteq \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$).

Lemma 1723 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A}$ an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Then $[T]^{\mathcal{I}^+, \text{Su}} = [T]^{\mathcal{I}, \text{Su}} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$.*

Proof: Let $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. Then, by Lemma 1620, $[T]^{\mathcal{I}, \text{Su}} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. Since $T = \bigcap [T]^{\mathcal{I}, \text{Su}}$, $[T]^{\mathcal{I}^+, \text{Su}} \subseteq [T]^{\mathcal{I}, \text{Su}}$ and $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$, we get $T = \bigcap [T]^{\mathcal{I}^+, \text{Su}}$. Hence $T \in \text{FiFam}^{\mathcal{I}^+, \text{Su}}(\mathcal{A})$. Again, using Lemma 1620, we get $[T]^{\mathcal{I}^+, \text{Su}} = \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})^T$. Therefore, we conclude that

$$\begin{aligned} [T]^{\mathcal{I}^+, \text{Su}} &= \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})^T \\ &= \text{FiFam}^{\mathcal{I}}(\mathcal{A})^T \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \\ &= [T]^{\mathcal{I}, \text{Su}} \cap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}). \end{aligned}$$
■

22.4 Leibniz Truth Equationality

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is **Leibniz truth equational** if there exists $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , such that, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,

$$T^* = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T)),$$

i.e., for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$,

$$\phi \in T_\Sigma^* \quad \text{iff} \quad \tau_\Sigma^{\mathcal{A}}[\phi] \leq \Omega^{\mathcal{A}}(T).$$

It follows directly by the definition that, if $\mathcal{I}$ is Leibniz truth equational, then, for all $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,

$$T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \quad \text{iff} \quad T = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T)).$$

Moreover, we can easily see that family truth equationality implies Leibniz truth equationality.

Lemma 1724 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is family truth equational, then $\mathcal{I}$ is Leibniz truth equational.*

Proof: Suppose that $\mathcal{I}$ is family truth equational, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . Thus, by Theorem 849, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$. Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}|$ and $\phi \in \mathbf{SEN}(\Sigma)$. We have

$$\begin{aligned} \phi \in T_\Sigma & \quad \text{iff} \quad \tau_\Sigma^{\mathcal{A}}[\phi] \leq \Omega^{\mathcal{A}}(T) \quad (\mathcal{I} \text{ truth equational}) \\ & \quad \text{implies} \quad \tau^{\mathcal{A}}[\phi] \leq \Omega^{\mathcal{A}}(T^*) \quad (T^* \in \llbracket T \rrbracket^*) \\ & \quad \text{iff} \quad \phi \in T_\Sigma^*. \quad (\mathcal{I} \text{ truth equational}) \end{aligned}$$

Thus, we get $T \leq T^*$. On the other hand, by Lemma 1605, $T^* \leq T$, whence $T = T^*$. This gives $T^* = T$ and, hence $T^* = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$, showing that $\mathcal{I}$ is Leibniz truth equational. $\blacksquare$

If $\mathcal{I}$ is Leibniz truth equational, then the collection of all its Leibniz filters on every algebraic system forms a closure family.

Proposition 1725 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$ is closed under signature-wise intersections and, hence, forms a closure family on $\mathcal{A}$.*

Proof: Suppose $\mathcal{I}$ is Leibniz truth-equational, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $\{T^i : i \in I\} \subseteq \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$ be a collection of Leibniz $\mathcal{I}$ -filter families. Then

$$\begin{aligned} \bigcap_{i \in I} T^i &= \bigcap_{i \in I} (T^i)^* \quad (T^i \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})) \\ &= \bigcap_{i \in I} \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T^i)) \quad (\mathcal{I} \text{ Leibniz truth equational}) \\ &\leq \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i)) \quad (\bigcap_{i \in I} \Omega^{\mathcal{A}}(T^i) \leq \Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i)) \\ &= (\bigcap_{i \in I} T^i)^*. \quad (\mathcal{I} \text{ Leibniz truth equational}) \end{aligned}$$

Since, by Lemma 1605, $(\bigcap_{i \in I} T^i)^* \leq \bigcap_{i \in I} T^i$, we get that $(\bigcap_{i \in I} T^i)^* = \bigcap_{i \in I} T^i$ and, therefore, $\bigcap_{i \in I} T^i \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. $\blacksquare$

The next proposition shows that to check that a given π -institution $\mathcal{I}$ is Leibniz truth equational, it is sufficient to work with $\mathcal{I}^*$ -algebraic systems only. That is, if the defining property holds for all Leibniz filters of $\mathcal{I}^*$ -algebraic systems, then it extends to Leibniz filters over arbitrary $\mathbf{F}$ -algebraic systems.

Proposition 1726 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is Leibniz truth equational if and only if, there exists $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , such that, for all $\mathcal{A} \in \text{AlgSys}^*(\mathcal{I})$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T^* = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$.*

Proof: The implication left-to-right follows from the definition of Leibniz truth equationality. Suppose, conversely, that there exists $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , such that, for all $\mathcal{A} \in \text{AlgSys}^*(\mathcal{I})$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T^* = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$. Let $\mathcal{A}$ be an arbitrary $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, and consider the quotient morphism $\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\Omega^{\mathcal{A}}(T)$. Then, by Corollary 1591, $\pi(T^*) = \pi(T)^*$ and, by Proposition 1567, $\pi(T)^*$ is the least $\mathcal{I}$ -filter family on $\mathcal{A}/\Omega^{\mathcal{A}}(T)$. Since $\mathcal{A}/\Omega^{\mathcal{A}}(T) \in \text{AlgSys}^*(\mathcal{I})$, we get, by hypothesis,

$$\pi(T)^* = \tau^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(T/\Omega^{\mathcal{A}}(T)) = \tau^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\Delta^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}).$$

Hence, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$,

$$\begin{aligned} \phi \in T_\Sigma^* & \text{ iff } \phi/\Omega_\Sigma^{\mathcal{A}}(T) \in \pi_\Sigma(T_\Sigma^*) \quad (\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^*)) \\ & \text{ iff } \phi/\Omega_\Sigma^{\mathcal{A}}(T) \in \pi(T)_\Sigma^* \\ & \text{ iff } \phi/\Omega_\Sigma^{\mathcal{A}}(T) \in \tau_\Sigma^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\Delta^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}) \\ & \text{ iff } \phi \in \tau_\Sigma^{\mathcal{A}}(\Omega^{\mathcal{A}}(T)). \end{aligned}$$

Thus, $\mathcal{I}$ is Leibniz truth equational. ■

A fortiori, it suffices to show that the condition in the statement of Proposition 1726 holds for all $\mathcal{I}$ -algebraic systems, since this class encompasses all $\mathcal{I}^*$ -algebraic systems.

Corollary 1727 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is Leibniz truth equational if and only if, there exists $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , such that, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T^* = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$.*

Proof: The conclusion follows from Proposition 1726, taking into account the fact that $\text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$. ■

Next, we provide another characterization of Leibniz truth equationality by showing that it is equivalent to $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}})$ being the least $\mathcal{I}$ -filter family on every $\mathcal{I}$ - (or $\mathcal{I}^*$ -) algebraic system.

Proposition 1728 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b . The following conditions are equivalent.*

- (i) $\mathcal{I}$ is Leibniz truth equational, with witnessing transformations τ^b ;
- (ii) For all $\mathcal{A} \in \text{AlgSys}^*(\mathcal{I})$, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$;
- (iii) For all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

Proof:

- (i) $\Rightarrow$ (iii) Suppose $\mathcal{I}$ is Leibniz truth equational, with witnessing transformations τ^b . Let $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$ and $T^m = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, by Lemma 1605, $T^m \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. Since $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \leq \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T^m))$, we get, by hypothesis, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) \leq T^m$. On the other hand, since $T^m = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we have, for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T^m \leq T^*$, whence, by hypothesis, $T^m \leq \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$. Since, this holds for all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we get, taking into account that $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,

$$T^m \leq \tau^{\mathcal{A}}(\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}))) = \tau^{\mathcal{A}}(\Delta^{\mathcal{A}}).$$

Therefore, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = T^m$.

- (iii) $\Rightarrow$ (ii) Trivial, since $\text{AlgSys}^*(\mathcal{I}) \subseteq \text{AlgSys}(\mathcal{I})$.

- (ii) $\Rightarrow$ (i) Suppose, for all $\mathcal{A} \in \text{AlgSys}^*(\mathcal{I})$, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\Omega^{\mathcal{A}}(T).$$

Then, $\mathcal{A}/\Omega^{\mathcal{A}}(T) \in \text{AlgSys}^*(\mathcal{I})$ and, by Corollary 1591, $\pi(T^*) = \pi(T)^*$ and, by Proposition 1567, $\pi(T)^* = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\Omega^{\mathcal{A}}(T))$. Thus, by hypothesis, $\pi(T^*) = \tau^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\Delta^{\mathcal{A}/\Omega^{\mathcal{A}}(T)})$. Therefore, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$,

$$\begin{aligned} \phi \in T_{\Sigma}^* & \text{ iff } \phi/\Omega_{\Sigma}^{\mathcal{A}}(T) \in \pi_{\Sigma}(T_{\Sigma}^*) \\ & \text{ iff } \phi/\Omega_{\Sigma}^{\mathcal{A}}(T) \in \tau_{\Sigma}^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\Delta^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}) \\ & \text{ iff } \phi \in \tau_{\Sigma}^{\mathcal{A}}(\Omega^{\mathcal{A}}(T)). \end{aligned}$$

Hence, τ^b witnesses the Leibniz truth equationality of $\mathcal{I}$. ■

If $\mathcal{I}$ -algebraic systems and $\mathcal{I}^+$ -algebraic systems coincide, then truth equationality of $\mathcal{I}^+$ guarantees the Leibniz truth equationality of $\mathcal{I}$.

Proposition 1729 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $\tau^b : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2$ in N^b . If $\mathcal{I}^+$ is family truth equational, with witnessing transformations τ^b and $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}(\mathcal{I}^+)$, then $\mathcal{I}$ is Leibniz truth equational, with witnessing transformations τ^b .*

Proof: We use Proposition 1728. Suppose $\mathcal{I}^+$ is family truth equational via τ^b and $\text{AlgSys}(\mathcal{I}) = \text{AlgSys}(\mathcal{I}^+)$. Let $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$. Since, by hypothesis $\mathcal{A} \in \text{AlgSys}(\mathcal{I}^+)$, we get, by hypothesis, Lemma 1724 and Proposition 1728, $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. By Lemma 1704, $\bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \bigcap \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. Hence, we get $\tau^{\mathcal{A}}(\Delta^{\mathcal{A}}) = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, whence, by Proposition 1728, $\mathcal{I}$ is Leibniz truth equational via τ^b . ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems. We define, as before, on $\mathbf{F}$ the closure system $C^{\mathbf{K}, \tau} = \{C_\Sigma^{\mathbf{K}, \tau}\}_{\Sigma \in |\mathbf{Sign}^b|}$, where, for all $\Sigma \in |\mathbf{Sign}^b|$, $C_\Sigma^{\mathbf{K}, \tau} : \mathcal{P}(\mathbf{SEN}^b(\Sigma)) \rightarrow \mathcal{P}(\mathbf{SEN}^b(\Sigma))$ is given, for all $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$, by

$$\phi \in C_\Sigma^{\mathbf{K}, \tau}(\Phi) \quad \text{iff} \quad \tau_\Sigma^b[\phi] \leq C_\Sigma^{\mathbf{K}}(\tau_\Sigma^b[\Phi]).$$

Then we say that $\mathbf{K}$ is a τ^b -**algebraic semantics for** $\mathcal{I}$ if $C = C^{\mathbf{K}, \tau}$.

We show that, if a π -institution $\mathcal{I}$ is Leibniz truth equational, with witnessing transformations τ^b , then any of the four classes $\text{AlgSys}^*(\mathcal{I}^+)$, $\text{AlgSys}(\mathcal{I}^+)$, $\text{AlgSys}^*(\mathcal{I})$ or $\text{AlgSys}(\mathcal{I})$ serves as a τ^b -algebraic semantics for $\mathcal{I}^+$.

Theorem 1730 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . Set $\mathbf{K} = \text{AlgSys}^*(\mathcal{I}^+)$ or $\text{AlgSys}(\mathcal{I}^+)$ or $\text{AlgSys}^*(\mathcal{I})$ or $\text{AlgSys}(\mathcal{I})$. Then $\mathbf{K}$ is a τ^b -algebraic semantics for $\mathcal{I}^+$.*

Proof: Let, first, $K = \text{AlgSys}^*(\mathcal{I})$ or $\text{AlgSys}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$. Then, we have $\phi \in C_\Sigma^+(\Phi)$ if and only if, by Proposition 1701, $\phi \in C_\Sigma^{M_{\mathbf{K}}^{\mathcal{I}, m}}(\Phi)$ if and only if, for all $\mathcal{A} \in \mathbf{K}$,

$$\alpha_\Sigma(\Phi) \subseteq C_{F(\Sigma)}^{\mathcal{I}, \mathcal{A}}(\emptyset) \quad \text{implies} \quad \alpha_\Sigma(\phi) \in C_{F(\Sigma)}^{\mathcal{I}, \mathcal{A}}(\emptyset).$$

if and only if, by hypothesis and Proposition 1728,

$$\alpha_\Sigma(\Phi) \subseteq \tau_{F(\Sigma)}^{\mathcal{A}}(\Delta^{\mathcal{A}}) \quad \text{implies} \quad \alpha_\Sigma(\phi) \in \tau_{F(\Sigma)}^{\mathcal{A}}(\Delta^{\mathcal{A}}),$$

if and only if

$$\tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_\Sigma(\Phi)] \leq \Delta^{\mathcal{A}} \quad \text{implies} \quad \tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_\Sigma(\phi)] \leq \Delta^{\mathcal{A}},$$

if and only if

$$\alpha(\tau_\Sigma^b[\Phi]) \leq \Delta^{\mathcal{A}} \quad \text{implies} \quad \alpha(\tau_\Sigma^b[\phi]) \leq \Delta^{\mathcal{A}},$$

if and only if $\tau_\Sigma^b[\phi] \leq C_\Sigma^{\mathbf{K}}(\tau_\Sigma^b[\Phi])$ if and only if $\phi \in C_\Sigma^{\mathbf{K}, \tau}(\Phi)$. Thus, $\mathbf{K}$ is a τ^b -algebraic semantics of $\mathcal{I}^+$.

Finally, note that, by hypothesis and Lemma 1708, $\mathcal{I}^+$ is Leibniz truth equational via τ^b , as well. Moreover, by Corollary 1705, $(\mathcal{I}^+)^+ = \mathcal{I}^+$. Applying, therefore, what was shown above to $\mathcal{I}^+$, we get the result for $\mathbf{K} = \text{AlgSys}^*(\mathcal{I}^+)$ or $\text{AlgSys}(\mathcal{I}^+)$. $\blacksquare$

Theorem 1730 implies that for $\text{AlgSys}(\mathcal{I})$ to be a τ^b -algebraic semantics of a Leibniz truth equational π -institution $\mathcal{I}$, where τ^b is a set of witnessing transformations, $\mathcal{I}$ and $\mathcal{I}^+$ must be identical.

Corollary 1731 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution based on $\mathbf{F}$, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . $\text{AlgSys}(\mathcal{I})$ is a τ^b -algebraic semantics for $\mathcal{I}$ if and only if $\mathcal{I} = \mathcal{I}^+$.*

Proof: By Theorem 1730, $C^+ = C^{\text{AlgSys}(\mathcal{I}), \tau}$. Therefore, we get that $\text{AlgSys}(\mathcal{I})$ is a τ^b -algebraic semantics of $\mathcal{I}$ if and only if, by definition $C = C^{\text{AlgSys}(\mathcal{I}), \tau}$ if and only if $C = C^+$. ■

Moreover, we can show that Leibniz truth equationality of $\mathcal{I}$ implies the family truth equationality of $\mathcal{I}^+$.

Corollary 1732 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is Leibniz truth equational, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$, then $\mathcal{I}^+$ is family truth equational via τ^b .*

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}^+}(\mathcal{A})$. By hypothesis and Theorem 1730, $\mathcal{I}^+$ has a τ^b -algebraic semantics. Therefore, by Corollary 825, $T = \tau^{\mathcal{A}}(\tilde{\Omega}^{\mathcal{I}^+, \mathcal{A}}(T)) \leq \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$. Conversely, by hypothesis and the fact that, by Proposition 1702, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we get, using Lemma 1605, $\tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T)) = T^* \leq T$. We now conclude that $T = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T))$. Thus, $\mathcal{I}^+$ is family truth equational, with witnessing transformations τ^b . ■

As another consequence, we get that, under Leibniz truth equationality, $\mathcal{I}^+$ filter families coincide with Leibniz $\mathcal{I}$ -filter families on any algebraic system.

Corollary 1733 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is Leibniz truth equational, then, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$.*

Proof: Suppose $\mathcal{I}$ is Leibniz truth equational. Then, by Corollary 1732, $\mathcal{I}^+$ is family truth equational. Thus, by Proposition 1710, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . Let, also, $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, by definition $T^{\mathcal{I}, \text{Su}} = \bigcap \llbracket T \rrbracket^{\mathcal{I}, \text{Su}}$ and, by Proposition 1621, $\langle \mathcal{A}, \llbracket T \rrbracket^{\mathcal{I}, \text{Su}} \rangle \in \text{FStr}(\mathcal{I})$. Thus, by Proposition 1621, $T^{\mathcal{I}, \text{Su}} \in \text{FiFam}^{\mathcal{I}*}(\mathcal{A})$. Now it follows, by hypothesis, that

$$T^{\mathcal{I}, \text{Su}} = \tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T^{\mathcal{I}, \text{Su}})).$$

There is also an additional characterization of the Suszko filter family, using the Suszko operator.

Proposition 1734 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$T^{\mathcal{I}, \text{Su}} = \tau^{\mathcal{A}}(\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)).$$

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T).$$

Then $\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) \in \text{AlgSys}(\mathcal{I})$. Moreover, by Lemma 1594, $\pi(T^{\mathcal{I}, \text{Su}}) = \pi(T)^{\mathcal{I}, \text{Su}}$ and, by Proposition 1624, $\pi(T)^{\mathcal{I}, \text{Su}} = \bigcap \text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T))$. Thus, by Proposition 1728,

$$\pi(T^{\mathcal{I}, \text{Su}}) = \tau^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}(\Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}).$$

Now we get

$$\begin{aligned} T^{\mathcal{I}, \text{Su}} &= \pi^{-1}(\pi(T^{\mathcal{I}, \text{Su}})) \\ &= \pi^{-1}(\tau^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)}(\Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)})) \\ &= \tau^{\mathcal{A}}(\pi^{-1}(\Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)})) \\ &= \tau^{\mathcal{A}}(\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)). \end{aligned}$$

This proves the statement. ■

Proposition 1734 enables us to characterize the Suszko filter counterpart $T^{\mathcal{I}, \text{Su}}$ of a given filter family T as the intersection of all Leibniz filter family companions of filter families in the upset of T .

Corollary 1735 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$T^{\mathcal{I}, \text{Su}} = \bigcap \{T'^* : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})\}.$$

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then we have

$$\begin{aligned} T^{\mathcal{I}, \text{Su}} &= \tau^{\mathcal{A}}(\tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)) \quad (\text{by Proposition 1734}) \\ &= \tau^{\mathcal{A}}(\bigcap \{\Omega^{\mathcal{A}}(T') : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})\}) \\ &\quad (\text{definition of } \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)) \\ &= \bigcap \{\tau^{\mathcal{A}}(\Omega^{\mathcal{A}}(T')) : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})\} \\ &= \bigcap \{T'^* : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})\}. \\ &\quad (\text{Leibniz truth equationality}) \end{aligned}$$

This proves the corollary. ■

We now get immediately

Corollary 1736 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$T \in \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{I}) \quad \text{iff} \quad T \leq T'^*, \text{ for all } T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T.$$

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then we have $T \in \mathbf{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$ if and only if, by definition, $T = T^{\mathcal{I}, \text{Su}}$ if and only if, by Corollary 1735, $T = \bigcap \{T'^* : T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T\}$, if and only if, taking into account that $T^* \leq T$, $T \leq T'^*$, for all $T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})^T$. ■

We close the section with a characterization of weak family algebraizability of the strong version of $\mathcal{I}$ among those π -institutions that are Leibniz truth equational.

Proposition 1737 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . $\mathcal{I}^+$ is weakly family algebraizable if and only if, for all $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I}^+)$, $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^+}(\mathcal{A})$ is an order isomorphism.*

Proof: If $\mathcal{I}^+$ is weakly family algebraizable, then it is, a fortiori, protoalgebraic. Therefore, by Proposition 1658, for all $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I}^+)$, $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^+}(\mathcal{A})$ is an order isomorphism.

Assume, conversely, that the condition in the statement holds. Then, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$,

$$\begin{aligned} \mathbf{FiFam}^{\mathcal{I}^+}(\mathcal{A}) &= \mathbf{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \quad (\text{by Corollary 1709}) \\ &= \mathbf{FiFam}^{\mathcal{I}^+}(\mathcal{A}). \quad (\text{by Corollary 1733}) \end{aligned}$$

Thus, for all $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I}^+)$, $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^+}(\mathcal{A})$ is an order isomorphism. Hence, by Theorem 296, $\mathcal{I}^+$ is weakly family algebraizable. ■

Proposition 1737 gives a sufficient condition for the weak family algebraizability of $\mathcal{I}^+$ that involves only $\mathcal{I}$ -algebraic systems.

Corollary 1738 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz truth equational π -institution, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b . If, for every $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I})$, $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism, then $\mathcal{I}^+$ is weakly family algebraizable.*

Proof: By hypothesis and Lemma 1716, for every $\mathcal{A} \in \mathbf{AlgSys}(\mathcal{I}^+)$, $\Omega^{\mathcal{A}} : \mathbf{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \rightarrow \mathbf{ConSys}^{\mathcal{I}^+}(\mathcal{A})$ is an order isomorphism. Hence, by Proposition 1737, $\mathcal{I}^+$ is weakly family algebraizable. ■

22.5 Leibniz Definability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is **Leibniz definable** if, there exists $\mu^b : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b , such that, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,

$$T^* = \mu^{\mathcal{A}}(T),$$

i.e., for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \mathbf{SEN}(\Sigma)$,

$$\phi \in T_\Sigma^* \quad \text{iff} \quad \mu_\Sigma^{\mathcal{A}}[\phi] \leq T.$$

We show that it suffices to consider only $\mathcal{I}^*$ -algebraic systems to establish Leibniz definability.

Proposition 1739 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is Leibniz definable if and only if, there exists $\mu^b : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b , such that, for all $\mathcal{A} \in \text{AlgSys}^*(\mathcal{I})$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T^* = \mu^{\mathcal{A}}(T)$.*

Proof: The “only if” is trivial. For the “if”, suppose the stated condition holds and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Consider the quotient morphism

$$\langle I, \pi \rangle : \mathcal{A} \rightarrow \mathcal{A}/\Omega^{\mathcal{A}}(T).$$

Then $\mathcal{A}/\Omega^{\mathcal{A}}(T) \in \text{AlgSys}^*(\mathcal{I})$ and, moreover, $\text{Ker}(\langle I, \pi \rangle) = \Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T^*)$, since $T^* \in \llbracket T \rrbracket^*$. Now we have

$$\begin{aligned} T^* &= \pi^{-1}(\pi(T^*)) \quad (\text{Ker}(\langle I, \pi \rangle) \text{ compatible with } T^*) \\ &= \pi^{-1}(\pi(T)^*) \quad (\text{by Lemma 1594}) \\ &= \pi^{-1}(\mu^{\mathcal{A}/\Omega^{\mathcal{A}}(T)}(\pi(T))) \quad (\text{by hypothesis}) \\ &= \mu^{\mathcal{A}}(\pi^{-1}(\pi(T))) \quad (\text{algebra and surjectivity of } \langle I, \pi \rangle) \\ &= \mu^{\mathcal{A}}(T). \quad (\text{Ker}(\langle I, \pi \rangle) \text{ compatible with } T) \end{aligned}$$

Therefore, $\mathcal{I}$ is Leibniz definable via μ^b . ■

Leibniz definability ensures that the mapping sending a filter family to its Leibniz counterpart is monotone and this, in turn, implies that T^* is the largest Leibniz filter family below T .

Lemma 1740 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz definable π -institution based on $\mathbf{F}$, with witnessing transformations $\mu^b : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b . For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$T \leq T' \quad \text{implies} \quad T^* \leq T'^*.$$

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $T \leq T'$. Then $T^* = \mu^{\mathcal{A}}(T) \leq \mu^{\mathcal{A}}(T') = T'^*$. ■

Corollary 1741 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz definable π -institution based on $\mathbf{F}$, with witnessing transformations $\mu^b : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b . For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, T^* is the largest Leibniz filter family below T .*

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Suppose $T' \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, such that $T' \leq T$. Then we have $T' = T'^* \leq T^*$, where the last inclusion is due to Lemma 1740. ■

Under Leibniz definability, the condition that $\Omega^{\mathcal{A}}$ be an order isomorphism from Leibniz filter families of $\mathcal{A}$ onto $\mathcal{I}^*$ -congruence systems on $\mathcal{A}$, for every $\mathcal{I}$ -algebraic system yields protoalgebraicity.

Proposition 1742 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz definable π -institution based on $\mathbf{F}$, with witnessing transformations $\mu^b : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b . If, for every $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism, then $\mathcal{I}$ is protoalgebraic.*

Proof: Suppose the stated condition holds and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then we have

$$\begin{aligned}
 \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T) &= \bigcap \{ \Omega^{\mathcal{A}}(T') : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \} \\
 &\quad (\text{definition of } \tilde{\Omega}^{\mathcal{I}, \mathcal{A}}(T)) \\
 &= \bigcap \{ \Omega^{\mathcal{A}}(T'^*) : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \} \\
 &\quad (\text{by Proposition 1714}) \\
 &= \Omega^{\mathcal{A}}(\bigcap \{ T'^* : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}) \\
 &\quad (\text{by the hypothesis}) \\
 &= \Omega^{\mathcal{A}}(T^*) \quad (\text{by Lemma 1740}) \\
 &= \Omega^{\mathcal{A}}(T). \quad (\text{by Proposition 1714})
 \end{aligned}$$

Hence, the Leibniz and Suszko operators on every $\mathbf{F}$ -algebraic system coincide, whence, by Lemma 1555, $\mathcal{I}$ is protoalgebraic. ■

We show, next, that, under Leibniz definability, the collection of Leibniz $\mathcal{I}$ -filter families on every $\mathbf{F}$ -algebraic system is closed under morphic images and preimages and under intersections.

Proposition 1743 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz definable π -institution based on $\mathbf{F}$, with witnessing transformations $\mu^b : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b .*

- (a) $\mathbf{M}(\mathbf{M}^{\mathcal{I}^*}) \subseteq \mathbf{M}^{\mathcal{I}^*}$ and $\mathbf{M}^{-1}(\mathbf{M}^{\mathcal{I}^*}) \subseteq \mathbf{M}^{\mathcal{I}^*}$;
- (b) $\mathbf{III}(\mathbf{M}^{\mathcal{I}^*}) \subseteq \mathbf{M}^{\mathcal{I}^*}$.

Proof:

- (a) Let $\mathcal{A}, \mathcal{B}$ be $\mathbf{F}$ -algebraic systems, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and $\langle H, \gamma \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{B}, T' \rangle$ a strict surjective morphism. We then have

$$\begin{aligned}
 T = T^* & \text{ iff } T = \mu^{\mathcal{A}}(T) \\
 & \text{ iff } \gamma^{-1}(T') = \mu^{\mathcal{A}}(\gamma^{-1}(T')) \\
 & \text{ iff } \gamma^{-1}(T') = \gamma^{-1}(\mu^{\mathcal{B}}(T')) \\
 & \text{ iff } T' = \mu^{\mathcal{B}}(T') \\
 & \text{ iff } T' = T'^*.
 \end{aligned}$$

Thus, $\langle \mathcal{A}, T \rangle \in \mathbf{M}^{\mathcal{I}^*}$ if and only if $\langle \mathcal{B}, T' \rangle \in \mathbf{M}^{\mathcal{I}^*}$.

- (b) Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $\{T^i : i \in I\} \subseteq \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. Then we have

$$\begin{aligned}
 \bigcap_{i \in I} T^i &= \bigcap_{i \in I} (T^i)^* \\
 &= \bigcap_{i \in I} \mu^{\mathcal{A}}(T^i) \\
 &= \mu^{\mathcal{A}}(\bigcap_{i \in I} T^i) \\
 &= (\bigcap_{i \in I} T^i)^*.
 \end{aligned}$$

Therefore $\bigcap_{i \in I} T^i \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. Thus, if $\langle \mathcal{A}, T^i \rangle \in \mathbf{M}^{\mathcal{I}^*}$, for all $i \in I$, then $\langle \mathcal{A}, \bigcap_{i \in I} T^i \rangle \in \mathbf{M}^{\mathcal{I}^*}$. ■

Proposition 1743, in conjunction with the characterization Theorem 1824 of the $\mathcal{I}^{\mathbf{M}}$ -matrix families for a class $\mathbf{M}$ of $\mathbf{F}$ -matrix families, allow us to prove that, under Leibniz definability, $\mathcal{I}^+$ -filter families and Leibniz $\mathcal{I}$ -filter families on any $\mathbf{F}$ -algebraic system coincide.

Theorem 1744 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz definable π -institution based on $\mathbf{F}$, with witnessing transformations $\mu^b : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b . For every $\mathbf{F}$ -algebraic system $\mathcal{A}$,*

$$\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}).$$

Proof: We have

$$\begin{aligned}
 \text{MatFam}(\mathcal{I}^+) &= \text{MatFam}(\mathcal{I}^{\mathbf{M}^{\mathcal{I}^*}}) \quad (\mathcal{I}^+ = \mathcal{I}^{\mathbf{M}^{\mathcal{I}^*}}, \text{ by definition}) \\
 &= \mathbf{MIIM}^{-1}(\mathbf{M}^{\mathcal{I}^*}) \quad (\text{by Theorem 1824}) \\
 &\subseteq \mathbf{M}^{\mathcal{I}^*}. \quad (\text{by Proposition 1743})
 \end{aligned}$$

This shows that $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. But, by Proposition 1702, the reverse inclusion always holds. Therefore, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. ■

We give several conditions involving the strong version of $\mathcal{I}$ that turn out to characterize both the protoalebraicity of $\mathcal{I}$ and the protoalgebraicity of $\mathcal{I}^+$, under the proviso that $\mathcal{I}$ be Leibniz definable.

Corollary 1745 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz definable π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}^+$ is protoalgebraic;
- (ii) $\mathcal{I}$ is protoalgebraic;
- (iii) For every $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^*}(\mathcal{A})$ is an order isomorphism;
- (iv) For every $\mathcal{A} \in \text{AlgSys}(\mathcal{I}^+)$, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^{+*}}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^{+*}}(\mathcal{A})$ is an order isomorphism;
- (v) $\mathcal{I}^+$ is weakly family algebraizable.

Proof:

- (i) $\Rightarrow$ (ii) Suppose $\mathcal{I}^+$ is protoalgebraic. Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $T \leq T'$. By Lemma 1740, $T^* \leq T'^*$. Hence, by Proposition 1702 and the hypothesis, $\Omega^{\mathcal{A}}(T^*) \leq \Omega^{\mathcal{A}}(T'^*)$. By hypothesis, Proposition 1658 and Proposition 1714, $\Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T')$. Thus, the Leibniz operator is monotone on the $\mathcal{I}$ -filter families of every $\mathbf{F}$ -algebraic system and, therefore, $\mathcal{I}$ is protoalgebraic.
- (ii) $\Rightarrow$ (iii) By Proposition 1658.
- (iii) $\Rightarrow$ (iv) By Lemma 1716.
- (iv) $\Rightarrow$ (v) We have, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$,

$$\begin{aligned} \text{FiFam}^{\mathcal{I}^{+*}}(\mathcal{A}) &= \text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) \quad (\text{by Corollary 1709}) \\ &= \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}). \quad (\text{by Theorem 1744}) \end{aligned}$$

Therefore, by hypothesis, $\Omega^{\mathcal{A}} : \text{FiFam}^{\mathcal{I}^+}(\mathcal{A}) \rightarrow \text{ConSys}^{\mathcal{I}^{+*}}(\mathcal{A})$ is an order isomorphism. By Theorem 296, $\mathcal{I}^+$ is weakly family algebraizable.

- (v) $\Rightarrow$ (i) If $\mathcal{I}^+$ is weakly family algebraizable, then it is, a fortiori, protoalgebraic. ■

Finally, we give some consequences of imposing both Leibniz definability and Leibniz truth equationality. The combination is strong enough to guarantee that Leibniz filter families and Suszko filter families coincide.

Proposition 1746 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz definable and Leibniz truth equational π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$T^* = T^{\mathcal{I}, \text{Su}}.$$

Proof: Let $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then

$$\begin{aligned} T^{\mathcal{I}, \text{Su}} &= \bigcap \{T'^* : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})\} \quad (\text{by Corollary 1735}) \\ &= T^*. \quad (\text{by Lemma 1740}) \end{aligned}$$

This proves the statement. ■

Corollary 1747 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Leibniz definable and Leibniz truth equational π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A}$,*

$$\text{FiFam}^{\mathcal{I}^*}(\mathcal{A}) = \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}).$$

Proof: Let $\mathcal{A} \in \text{AlgSys}(\mathbf{F})$. By Lemma 1620, $\text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A}) \subseteq \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$. On the other hand, if $T \in \text{FiFam}^{\mathcal{I}^*}(\mathcal{A})$, then, by Proposition 1746, $T = T^* = T^{\mathcal{I}, \text{Su}}$. Thus, $T \in \text{FiFam}^{\mathcal{I}, \text{Su}}(\mathcal{A})$. ■

Chapter 23

The Frege Hierarchy

23.1 The Frege Hierarchy

23.2 Self Extensionality and Implication

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ a binary natural transformation in N^b and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.

We say that $\rightarrow^b$ has the **Deduction Detachment Property** in $\mathcal{I}$ if, for all $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi, \psi\} \subseteq \mathbf{SEN}(\Sigma)$,

$$\psi \in C_\Sigma(\Phi, \phi) \quad \text{iff} \quad \phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\Phi).$$

$\mathcal{I}$ has the **Uniterm Deduction Detachment Property with respect to $\rightarrow^b$** if $\rightarrow^b$ has the Deduction Detachment Property in $\mathcal{I}$. $\mathcal{I}$ has the **Uniterm Deduction Detachment Property** if it has the Uniterm Deduction Detachment Property with respect to some $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b .

If a π -institution has the Uniterm Deduction Detachment Theorem with respect to two different binary natural transformations in N^b , then the two must be interderivable in the following precise sense.

Lemma 1748 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b, \rightarrow'^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ has the Uniterm Deduction Detachment Property with respect to both $\rightarrow^b$ and $\rightarrow'^b$, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,*

$$C_\Sigma(\phi \rightarrow_\Sigma^b \psi) = C_\Sigma(\phi \rightarrow_\Sigma'^b \psi).$$

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$. We have $\phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\phi \rightarrow_\Sigma^b \psi)$. By the Uniterm Deduction Detachment Property with respect to $\rightarrow^b$, we get $\psi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi)$. By the Uniterm Deduction Detachment Property with respect to $\rightarrow'^b$, we get $\phi \rightarrow_\Sigma'^b \psi \in C_\Sigma(\phi \rightarrow_\Sigma^b \psi)$. Using symmetry, we obtain that $C_\Sigma(\phi \rightarrow_\Sigma^b \psi) = C_\Sigma(\phi \rightarrow_\Sigma'^b \psi)$. ■

Thus, for self extensional π -institutions, we get immediately

Corollary 1749 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b, \rightarrow'^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a self extensional π -institution based on $\mathbf{F}$. If $\mathcal{I}$ has the Uniterm Deduction Detachment Property with respect to both $\rightarrow^b$ and $\rightarrow'^b$, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,*

$$\langle \phi \rightarrow_\Sigma^b \psi, \phi \rightarrow_\Sigma'^b \psi \rangle \in \widetilde{\Omega}_\Sigma(\mathcal{I}).$$

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$. By Lemma 1748, $\langle \phi \rightarrow_\Sigma^b \psi, \phi \rightarrow_\Sigma'^b \psi \rangle \in \widetilde{\lambda}_\Sigma(\mathcal{I})$. But, by self extensionality, $\widetilde{\lambda}(\mathcal{I}) = \widetilde{\Omega}(\mathcal{I})$. This yields the conclusion. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems. The class $\mathbf{K}$ is said to be **Hilbert based with respect to** $\rightarrow^b$ if, for all $\mathcal{A} \in \mathbf{K}$, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi, \chi \in \mathbf{SEN}(\Sigma)$,

$$\text{H1. } \phi \rightarrow_{\Sigma}^{\mathcal{A}} \phi = \psi \rightarrow_{\Sigma}^{\mathcal{A}} \psi;$$

$$\text{H2. } (\phi \rightarrow_{\Sigma}^{\mathcal{A}} \phi) \rightarrow_{\Sigma}^{\mathcal{A}} \phi = \phi;$$

$$\text{H3. } \phi \rightarrow_{\Sigma}^{\mathcal{A}} (\psi \rightarrow_{\Sigma}^{\mathcal{A}} \chi) = (\phi \rightarrow_{\Sigma}^{\mathcal{A}} \psi) \rightarrow_{\Sigma}^{\mathcal{A}} (\phi \rightarrow_{\Sigma}^{\mathcal{A}} \chi);$$

$$\text{H4. } (\phi \rightarrow_{\Sigma}^{\mathcal{A}} \psi) \rightarrow_{\Sigma}^{\mathcal{A}} ((\psi \rightarrow_{\Sigma}^{\mathcal{A}} \phi) \rightarrow_{\Sigma}^{\mathcal{A}} \psi) = (\psi \rightarrow_{\Sigma}^{\mathcal{A}} \phi) \rightarrow_{\Sigma}^{\mathcal{A}} ((\phi \rightarrow_{\Sigma}^{\mathcal{A}} \psi) \rightarrow_{\Sigma}^{\mathcal{A}} \phi).$$

These equations are commonly referred to as the **Hilbert equations**. The class $\mathbf{K}$ is **Hilbert based** if it is Hilbert based with respect to $\rightarrow^b$, for some $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b .

A class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems is called **pointed** if there exists $\tau^b: (\mathbf{SEN}^b)^k \rightarrow \mathbf{SEN}^b$ in N^b , such that, for all $\mathcal{A} \in \mathbf{K}$, all $\Sigma \in |\mathbf{Sign}|$ and all $\vec{\phi}, \vec{\psi} \in \mathbf{SEN}(\Sigma)$,

$$\tau_{\Sigma}^{\mathcal{A}}(\vec{\phi}) = \tau_{\Sigma}^{\mathcal{A}}(\vec{\psi}).$$

τ^b is then called a **constant in** $\mathbf{K}$ and we sometimes write $\tau_{\Sigma}^{\mathcal{A}}$ for $\tau_{\Sigma}^{\mathcal{A}}(\vec{\phi})$, since this value is independent of the argument $\vec{\phi} \in \mathbf{SEN}(\Sigma)$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathbf{K}$ a Hilbert based class with respect to $\rightarrow^b$. Then, by the Hilbert equation H1, the natural transformation $\tau^b: \mathbf{SEN}^b \rightarrow \mathbf{SEN}^b$ in N^b defined by

$$\tau^b := \rightarrow^b \circ \langle p^{1,0}, p^{1,0} \rangle$$

(in abbreviated more readable form $\tau^b(x) := x \rightarrow^b x$) is a constant in $\mathbf{K}$. So in this case, it makes sense to write $\tau_{\Sigma}^{\mathcal{A}}$ for the constant defined by this natural transformation in $\mathcal{A} \in \mathbf{K}$, for $\Sigma \in |\mathbf{Sign}|$.

Moreover, for $\mathcal{A} \in \mathbf{K}$, we define the relation family $\leq^{\mathcal{A}} = \{\leq_{\Sigma}^{\mathcal{A}}\}_{\Sigma \in |\mathbf{Sign}|}$ on $\mathcal{A}$ by setting, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$,

$$\phi \leq_{\Sigma}^{\mathcal{A}} \psi \quad \text{iff} \quad \phi \rightarrow_{\Sigma}^{\mathcal{A}} \psi = \tau_{\Sigma}^{\mathcal{A}}.$$

It is not difficult to see that this is actually a partial order system on $\mathcal{A}$.

Lemma 1750 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with a binary $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathbf{K}$ a Hilbert based class with respect to $\rightarrow^b$. For all $\mathcal{A} \in \mathbf{K}$, $\leq^{\mathcal{A}}$ is a posystem on $\mathcal{A}$.*

Proof: We show, first, that, for all $\Sigma \in |\mathbf{Sign}|$, $\leq_{\Sigma}^{\mathcal{A}}$ is a partial order on $\mathbf{SEN}(\Sigma)$. Let $\phi, \psi, \chi \in \mathbf{SEN}(\Sigma)$.

- By definition $\phi \rightarrow_{\Sigma}^{\mathcal{A}} \phi = \tau_{\Sigma}^{\mathcal{A}}$, whence $\phi \leq_{\Sigma}^{\mathcal{A}} \phi$ and $\leq_{\Sigma}^{\mathcal{A}}$ is reflexive;

- Suppose $\phi \leq_{\Sigma}^A \psi$ and $\psi \leq_{\Sigma}^A \phi$. Then, we get $\phi \rightarrow_{\Sigma}^A \psi = \psi \rightarrow_{\Sigma}^A \phi = \tau_{\Sigma}^A$. Thus, we get

$$\begin{aligned}
 \phi &= \tau_{\Sigma}^A \rightarrow_{\Sigma}^A \phi \quad (\text{by H2}) \\
 &= \tau_{\Sigma}^A \rightarrow_{\Sigma}^A (\tau_{\Sigma}^A \rightarrow_{\Sigma}^A \phi) \quad (\text{by H2}) \\
 &= \tau_{\Sigma}^A \rightarrow_{\Sigma}^A (\tau_{\Sigma}^A \rightarrow_{\Sigma}^A \psi) \quad (\text{by H4}) \\
 &= \tau_{\Sigma}^A \rightarrow_{\Sigma}^A \psi \quad (\text{by H2}) \\
 &= \psi. \quad (\text{by H2})
 \end{aligned}$$

Hence, $\leq_{\Sigma}^A$ is antisymmetric;

- Suppose $\phi \leq_{\Sigma}^A \psi$ and $\psi \leq_{\Sigma}^A \chi$. Then $\phi \rightarrow_{\Sigma}^A \psi = \psi \rightarrow_{\Sigma}^A \chi = \tau_{\Sigma}^A$. Thus, we get

$$\begin{aligned}
 \phi \rightarrow_{\Sigma}^A \chi &= \tau_{\Sigma}^A \rightarrow_{\Sigma}^A (\phi \rightarrow_{\Sigma}^A \chi) \quad (\text{by H2}) \\
 &= (\phi \rightarrow_{\Sigma}^A \psi) \rightarrow_{\Sigma}^A (\phi \rightarrow_{\Sigma}^A \chi) \quad (\text{hypothesis}) \\
 &= \phi \rightarrow_{\Sigma}^A (\psi \rightarrow_{\Sigma}^A \chi) \quad (\text{by H3}) \\
 &= \phi \rightarrow_{\Sigma}^A \tau_{\Sigma}^A \quad (\text{hypothesis}) \\
 &= \phi \rightarrow_{\Sigma}^A (\phi \rightarrow_{\Sigma}^A \phi) \quad (\text{definition}) \\
 &= (\phi \rightarrow_{\Sigma}^A \phi) \rightarrow_{\Sigma}^A (\phi \rightarrow_{\Sigma}^A \phi) \quad (\text{by H3}) \\
 &= \tau_{\Sigma}^A. \quad (\text{definition})
 \end{aligned}$$

So $\leq_{\Sigma}^A$ is also transitive.

Thus, $\leq^A$ is a partial order family on $\mathcal{A}$. We show that, in addition, it is a system, i.e., it is invariant under signature morphisms. To this end, suppose $\Sigma, \Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\phi \leq_{\Sigma}^A \psi$. Then $\phi \rightarrow_{\Sigma}^A \psi = \tau_{\Sigma}^A$. Hence, $\text{SEN}(f)(\phi \rightarrow_{\Sigma}^A \psi) = \text{SEN}(f)(\tau_{\Sigma}^A)$. This gives

$$\text{SEN}(f)(\phi) \rightarrow_{\Sigma'}^A \text{SEN}(f)(\psi) = \tau_{\Sigma'}^A.$$

We conclude that $\text{SEN}(f)(\phi) \leq_{\Sigma'}^A \text{SEN}(f)(\psi)$. Therefore, $\leq^A$ is indeed a posystem on $\mathcal{A}$. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a Hilbert based class with respect to $\rightarrow^b$, $\mathcal{A} \in \mathbf{K}$ and $T \in \text{SenFam}(\mathcal{A})$. We say that T is an $\rightarrow^b$ -**implicative filter family** of $\mathcal{A}$ if

- $\tau_{\Sigma}^A \in T_{\Sigma}$, for all $\Sigma \in |\mathbf{Sign}|$;
- $\phi \rightarrow_{\Sigma}^A \psi \in T_{\Sigma}$ and $\phi \in T_{\Sigma}$ imply $\psi \in T_{\Sigma}$, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$.

We write $\text{FiFam}^{\rightarrow}(\mathcal{A})$ for the collection of all $\rightarrow^b$ -implicative filter families on $\mathcal{A}$.

Next, we show that in any $\mathbf{F}$ -algebraic system $\mathcal{A}$ in a Hilbert based class $\mathbf{K}$, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi_0, \dots, \phi_{n-1}, \phi \in \text{SEN}(\Sigma)$,

$$\begin{aligned}
 \phi_0 \rightarrow_{\Sigma}^A (\phi_1 \rightarrow_{\Sigma}^A \dots \rightarrow_{\Sigma}^A (\phi_{n-1} \rightarrow_{\Sigma}^A \phi) \dots) &= \tau_{\Sigma}^A \\
 \text{iff } \phi_{\pi(0)} \rightarrow_{\Sigma}^A (\phi_{\pi(1)} \rightarrow_{\Sigma}^A \dots \rightarrow_{\Sigma}^A (\phi_{\pi(n-1)} \rightarrow_{\Sigma}^A \phi) \dots) &= \tau_{\Sigma}^A,
 \end{aligned}$$

where π is any permutation of $\{0, \dots, n-1\}$.

Lemma 1751 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with a binary $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathbf{K}$ a Hilbert based class of $\mathbf{F}$ -algebraic systems with respect to $\rightarrow^b$. For all $\mathcal{A} \in \mathbf{K}$, all $\Sigma \in |\mathbf{Sign}|$, all $\phi_0, \phi_1, \dots, \phi_{n-1}, \phi \in \mathbf{SEN}(\Sigma)$ and every permutation π of $\{0, 1, \dots, n-1\}$,*

$$\begin{aligned} \phi_0 \rightarrow_{\Sigma}^{\mathcal{A}} (\phi_1 \rightarrow_{\Sigma}^{\mathcal{A}} \dots \rightarrow_{\Sigma}^{\mathcal{A}} (\phi_{n-1} \rightarrow_{\Sigma}^{\mathcal{A}} \phi) \dots) &= \tau_{\Sigma}^{\mathcal{A}} \\ \text{iff } \phi_{\pi(0)} \rightarrow_{\Sigma}^{\mathcal{A}} (\phi_{\pi(1)} \rightarrow_{\Sigma}^{\mathcal{A}} \dots \rightarrow_{\Sigma}^{\mathcal{A}} (\phi_{\pi(n-1)} \rightarrow_{\Sigma}^{\mathcal{A}} \phi) \dots) &= \tau_{\Sigma}^{\mathcal{A}}. \end{aligned}$$

Proof:

■

Lemma 1751 allows us to write

$$\vec{\Phi} \rightarrow_{\Sigma}^{\mathcal{A}} \phi = \tau_{\Sigma}^{\mathcal{A}}$$

for $\phi_0 \rightarrow_{\Sigma}^{\mathcal{A}} (\phi_1 \rightarrow_{\Sigma}^{\mathcal{A}} \dots \rightarrow_{\Sigma}^{\mathcal{A}} (\phi_{n-1} \rightarrow_{\Sigma}^{\mathcal{A}} \phi) \dots) = \tau_{\Sigma}^{\mathcal{A}}$, where $\Phi = \{\phi_0, \dots, \phi_{n-1}\}$, when appropriate, since the equation does not depend on the order in which the elements of Φ are arranged in the implication expression. Moreover, for convenience, if $\Phi = \emptyset$, we take

$$\vec{\Phi} \rightarrow_{\Sigma}^{\mathcal{A}} \phi := \phi.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , $\mathbf{K}$ a Hilbert based class with respect to $\rightarrow^b$, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary π -institution based on $\mathbf{F}$. $\mathcal{I}$ is called **Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$** if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq_f \mathbf{SEN}^b(\Sigma)$,

$$\phi \in C_{\Sigma}(\Phi) \quad \text{iff} \quad \text{for all } \mathcal{A} \in \mathbf{K}, \alpha_{\Sigma}(\vec{\Phi} \rightarrow_{\Sigma}^b \phi) = \tau_{F(\Sigma)}^{\mathcal{A}}.$$

We say that $\mathcal{I}$ is **Hilbert based** if there exists $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b and a Hilbert based class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems with respect to $\rightarrow^b$, such that $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$.

Corollary 1752 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with a binary $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , $\mathbf{K}$ a Hilbert based class with respect to $\rightarrow^b$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution with respect to $\mathbf{K}$ and $\rightarrow^b$. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,*

$$C_{\Sigma}(\phi) = C_{\Sigma}(\psi) \quad \text{iff} \quad \langle \phi, \psi \rangle \in \text{Ker}_{\Sigma}(\mathbf{K}).$$

Proof: Suppose $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$, $C_{\Sigma}(\phi) = C_{\Sigma}(\psi)$ if and only if, by definition, for all $\mathcal{A} \in \mathbf{K}$, $\alpha_{\Sigma}(\phi \rightarrow_{\Sigma}^b \psi) = \alpha_{\Sigma}(\psi \rightarrow_{\Sigma}^b \phi) = \tau_{F(\Sigma)}^{\mathcal{A}}$, if and only if, by Lemma 1750, for all $\mathcal{A} \in \mathbf{K}$, $\alpha_{\Sigma}(\phi) = \alpha_{\Sigma}(\psi)$, if and only if, $\langle \phi, \psi \rangle \in \text{Ker}_{\Sigma}(\mathbf{K})$. ■

It is not difficult to see that if a π -institution is Hilbert based with respect to a Hilbert based class $\mathbf{K}$, then it is also Hilbert based with respect to the semantic variety generated by $\mathbf{K}$.

Lemma 1753 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with a binary $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , $\mathbf{K}$ a Hilbert based class with respect to $\rightarrow^b$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution with respect to $\mathbf{K}$ and $\rightarrow^b$. Then $\mathcal{I}$ is also Hilbert based with respect to $\mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$ and $\rightarrow^b$.*

Proof: Assume that $\mathcal{I}$ is Hilbert based with respect $\mathbf{K}$ and $\rightarrow^b$. First, note that, since, for all $\mathcal{A} \in \mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$, $\text{Ker}(\mathbf{K}) \leq \text{Ker}(\mathcal{A})$, all $\mathbf{F}$ -algebraic systems in $\mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$ satisfy the Hilbert equations and, hence, $\mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$ is a Hilbert based class with respect to $\rightarrow^b$.

Let $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq_f \mathbf{SEN}^b(\Sigma)$.

Suppose $\phi \in C_\Sigma(\Phi)$ and let $\mathcal{A} \in \mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$. By hypothesis $\langle \vec{\Phi} \rightarrow_\Sigma^b \phi, \tau_\Sigma^b \rangle \in \text{Ker}_\Sigma(\mathbf{K})$. Since $\mathcal{A} \in \mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$, $\text{Ker}(\mathbf{K}) \leq \text{Ker}(\mathcal{A})$. Therefore, $\langle \vec{\Phi} \rightarrow_\Sigma^b \phi, \tau_\Sigma^b \rangle \in \text{Ker}_\Sigma(\mathcal{A})$. This shows that $\alpha_\Sigma(\vec{\Phi} \rightarrow_\Sigma^b \phi) = \tau_{F(\Sigma)}^{\mathcal{A}}$. Conversely, if, for all $\mathcal{A} \in \mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$, $\alpha_\Sigma(\vec{\Phi} \rightarrow_\Sigma^b \phi) = \tau_{F(\Sigma)}^{\mathcal{A}}$, then this holds, a fortiori, for all $\mathcal{A} \in \mathbf{K}$ and, hence, by the hypothesis $\phi \in C_\Sigma(\Phi)$.

Thus, $\mathcal{I}$ is Hilbert based both with respect to $\mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$ and $\rightarrow^b$. $\blacksquare$

Corollary 1754 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with a binary $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , $\mathbf{K}$ a Hilbert based class with respect to $\rightarrow^b$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution with respect to $\mathbf{K}$ and $\rightarrow^b$. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,*

$$C_\Sigma(\phi) = C_\Sigma(\psi) \quad \text{iff} \quad \langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbf{V}^{\mathbf{Sem}}(\mathbf{K})).$$

Proof: By Corollary 1752 and Lemma 1753. $\blacksquare$

We can also show that, if $\mathbf{K}$ and $\mathbf{K}'$ are two Hilbert based classes of $\mathbf{F}$ -algebraic systems with respect to binary transformations $\rightarrow^b$ and $\rightarrow'^b$ in N^b , respectively, and a π -institution $\mathcal{I}$ happens to be Hilbert based with respect to both $\mathbf{K}$ and $\rightarrow^b$ and $\mathbf{K}'$ and $\rightarrow'^b$, then, the two classes $\mathbf{K}$ and $\mathbf{K}'$ generate the same semantic variety of $\mathbf{F}$ -algebraic systems.

Proposition 1755 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b, \rightarrow'^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , $\mathbf{K}$ a Hilbert class with respect to $\rightarrow^b$ and $\mathbf{K}'$ a Hilbert class with respect to $\rightarrow'^b$. If $\mathcal{I} = \langle \mathbf{F}, C \rangle$ is a π -institution that is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$ and Hilbert based with respect to $\mathbf{K}'$ and $\rightarrow'^b$, then $\mathbf{V}^{\mathbf{Sem}}(\mathbf{K}) = \mathbf{V}^{\mathbf{Sem}}(\mathbf{K}')$.*

Proof: We show that $\mathbf{K}' \subseteq \mathbf{V}^{\mathbf{Sem}}(\mathbf{K})$. Then the conclusion will follow by symmetry. To this end, let $\Sigma \in |\mathbf{Sign}^b|$, $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbf{K})$, and $\mathcal{A}' \in \mathbf{K}'$. By hypothesis, for all $\mathcal{A}$, $\alpha_\Sigma(\phi) = \alpha_\Sigma(\psi)$. Hence, for all $\mathcal{A} \in \mathbf{K}$, $\alpha_\Sigma(\phi \rightarrow_\Sigma^b \psi) = \alpha_\Sigma(\psi \rightarrow_\Sigma^b \phi) = \tau_{F(\Sigma)}^{\mathcal{A}}$. Thus, since $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$, we get $C_\Sigma(\phi) = C_\Sigma(\psi)$. But,

by hypothesis, $\mathcal{I}$ is also Hilbert based with respect to $\mathbf{K}'$ and $\rightarrow'^b$, whence $\alpha'_\Sigma(\phi \rightarrow'_\Sigma \psi) = \alpha'_\Sigma(\psi \rightarrow'_\Sigma \phi) = \tau_{F'(\Sigma)}^{A'}$. Hence, by Lemma 1750, $\alpha'_\Sigma(\phi) = \alpha'_\Sigma(\psi)$ or, equivalently, $\langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathcal{A}')$. This shows that $\mathcal{A}' \in \mathbb{V}^{\text{Sem}}(\mathbf{K})$. Thus, $\mathbf{K}' \subseteq \mathbb{V}^{\text{Sem}}(\mathbf{K})$. ■

We conclude that, if $\mathcal{I} = \langle \mathbf{F}, C \rangle$ is a Hilbert based π -institution, there is a unique semantic variety of $\mathbf{F}$ -algebraic systems, with respect to which it is Hilbert based. We denote this semantic variety by $\mathbb{V}^{\text{Sem}}(\mathcal{I})$ and call it the **semantic variety of $\mathcal{I}$** .

A key result is that every Hilbert based π -institution is self extensional and has the Deduction Detachment Property. We also show that the semantic variety of $\mathcal{I}$ coincides with the class $\mathbf{K}^\mathcal{I}$, the semantic variety of $\mathcal{I}$.

Proposition 1756 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a Hilbert based class with respect to $\rightarrow^b$, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution with respect to $\mathbf{K}$ and $\rightarrow^b$.*

- (a) $\mathcal{I}$ is self extensional;
- (b) $\mathcal{I}$ has the Deduction Detachment Property with respect to $\rightarrow^b$;
- (c) $\mathbb{V}^{\text{Sem}}(\mathcal{I}) = \mathbf{K}^\mathcal{I}$; Thus, $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}^\mathcal{I}$ and $\rightarrow^b$.

Proof:

- (a) We must show that $\tilde{\Lambda}(\mathcal{I}) = \tilde{\Omega}(\mathcal{I})$. Since $\tilde{\Omega}(\mathcal{I})$ is the largest congruence system on $\mathbf{F}$ that is included in $\tilde{\Lambda}(\mathcal{I})$, it suffices to show that $\tilde{\Lambda}(\mathcal{I})$ is a congruence system. To this end, let σ^b be a natural transformation in N^b , $\Sigma \in |\mathbf{Sign}^b|$ and $\vec{\phi}, \vec{\psi} \in \text{SEN}^b(\Sigma)$, such that $\langle \phi_i, \psi_i \rangle \in \tilde{\Lambda}_\Sigma(\mathcal{I})$, for all $i < k$. Hence, by definition, $C_\Sigma(\phi_i) = C_\Sigma(\psi_i)$, for all $i \in I$. Since $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$, we get, by Corollary 1752, $\langle \phi_i, \psi_i \rangle \in \text{Ker}_\Sigma(\mathbf{K})$, for all $i < k$. But $\text{Ker}(\mathbf{K})$ is a congruence system on $\mathbf{F}$, whence $\langle \sigma_\Sigma^b(\vec{\phi}), \sigma_\Sigma^b(\vec{\psi}) \rangle \in \text{Ker}_\Sigma(\mathbf{K})$. Again, by Corollary 1752, $C_\Sigma(\sigma_\Sigma^b(\vec{\phi})) = C_\Sigma(\sigma_\Sigma^b(\vec{\psi}))$ and, therefore, $\langle \sigma_\Sigma^b(\vec{\phi}), \sigma_\Sigma^b(\vec{\psi}) \rangle \in \tilde{\Lambda}_\Sigma(\mathcal{I})$. We conclude that $\tilde{\Lambda}(\mathcal{I}) = \tilde{\Omega}(\mathcal{I})$ and, hence, $\mathcal{I}$ is self extensional.
- (b) Let $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi, \psi\} \subseteq \text{SEN}^b(\Sigma)$.
 - Suppose that $\psi \in C_\Sigma(\Phi, \phi)$. Since $\mathcal{I}$ is finitary, there exists $\Phi' \subseteq_f \Phi$, such that $\psi \in C_\Sigma(\Phi', \phi)$. Since $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$, we get $\langle \vec{\Phi'} \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \psi), \tau_\Sigma^b \rangle \in \text{Ker}_\Sigma(\mathbf{K})$. Thus, again, since $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$, $\phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\Phi') \subseteq C_\Sigma(\Phi)$.
 - Suppose, conversely, that $\phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\Phi)$. Again, by finitariness, there exists $\Phi' \subseteq_f \Phi$, such that $\phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\Phi')$. Hence, since $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$, $\langle \vec{\Phi'} \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \psi), \tau_\Sigma^b \rangle \in$

$\text{Ker}_\Sigma(\mathbf{K})$. But, again by the fact that $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$, we get that $\psi \in C_\Sigma(\Phi', \phi) \subseteq C_\Sigma(\Phi, \phi)$.

Hence $\mathcal{I}$ has the Deduction Detachment Property with respect to $\rightarrow^b$.

(c) Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{SEN}^b(\Sigma)$. We have

$$\begin{aligned} \langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbf{V}^{\text{Sem}}(\mathcal{I})) & \text{ iff } C_\Sigma(\phi) = C_\Sigma(\psi) \quad (\text{by Corollary 1754}) \\ & \text{ iff } \langle \phi, \psi \rangle \in \widetilde{\lambda}_\Sigma(\mathcal{I}) \quad (\text{by definition}) \\ & \text{ iff } \langle \phi, \psi \rangle \in \widetilde{\Omega}_\Sigma(\mathcal{I}) \quad (\text{by Part (a)}) \\ & \text{ iff } \langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbf{K}^\mathcal{I}). \quad (\text{by definition}) \end{aligned}$$

Therefore, since $\mathbf{K}^\mathcal{I}$ is a semantic variety by definition, we get that $\mathbf{V}^{\text{Sem}}(\mathcal{I}) = \mathbf{K}^\mathcal{I}$. The last statement follows now by Lemma 1753. $\blacksquare$

If $\mathcal{I}$ is Hilbert based, not only is the semantic variety with respect to which it is Hilbert based unique, but, in addition, any two binary natural transformations that serve as the Hilbert implications are in a sense interderivable and, hence, indistinguishable modulo the Tarski congruence system of $\mathcal{I}$.

Corollary 1757 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b, \rightarrow'^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution with respect to $\rightarrow^b$ and with respect to $\rightarrow'^b$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,*

$$(a) \quad C_\Sigma(\phi \rightarrow_\Sigma^b \psi) = C_\Sigma(\phi \rightarrow'_\Sigma^b \psi);$$

$$(b) \quad \langle \phi \rightarrow_\Sigma^b \psi, \phi \rightarrow'_\Sigma^b \psi \rangle \in \widetilde{\Omega}_\Sigma(\mathcal{I}).$$

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{SEN}^b(\Sigma)$. Then

$$\begin{aligned} \phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\phi \rightarrow_\Sigma^b \psi) & \text{ iff } \psi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi) \quad (\text{Proposition 1756}) \\ & \text{ iff } \phi \rightarrow'_\Sigma^b \psi \in C_\Sigma(\phi \rightarrow_\Sigma^b \psi). \quad (\text{Proposition 1756}) \end{aligned}$$

Therefore, $\phi \rightarrow'_\Sigma^b \psi \in C_\Sigma(\phi \rightarrow_\Sigma^b \psi)$. By symmetry, we get the conclusion of Part (a). Part (b) follows by Proposition 1756, which asserts that $\mathcal{I}$ is self extensional. $\blacksquare$

If $\mathcal{I}$ is self extensional and has the Deduction Detachment Property with respect to $\rightarrow^b$, it turns out that the singleton class $\mathbf{K} = \{\mathcal{F}/\widetilde{\Omega}(\mathcal{I})\}$, consisting of the Lindenbaum-Tarski $\mathbf{F}$ -algebraic system of $\mathcal{I}$, is Hilbert based with respect to $\rightarrow^b$.

Lemma 1758 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with a binary $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary self extensional π -institution, having the Deduction Detachment Property with respect to $\rightarrow^b$. The class $\mathbf{K} = \{\mathcal{F}/\widetilde{\Omega}(\mathcal{I})\}$ is Hilbert based with respect to $\rightarrow^b$.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$.

(H1) By the Deduction Detachment Property with respect to $\rightarrow^b$, we get $C_\Sigma(\phi \rightarrow_\Sigma^b \phi) = C_\Sigma(\psi \rightarrow_\Sigma^b \psi) = C_\Sigma(\emptyset)$. Therefore, by self extensionality, $\langle \phi \rightarrow_\Sigma^b \phi, \psi \rightarrow_\Sigma^b \psi \rangle \in \tilde{\Omega}_\Sigma(\mathcal{I})$;

(H2) We have $\phi \rightarrow_\Sigma^b \phi \in C_\Sigma(\phi \rightarrow_\Sigma^b \phi)$, whence $\phi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \phi)$ and, hence, $(\phi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \phi \in C_\Sigma(\phi)$.

On the other hand, $(\phi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \phi \in C_\Sigma((\phi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \phi)$, whence $\phi \in C_\Sigma((\phi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \phi, \phi \rightarrow_\Sigma^b \phi)$ and, since $\phi \rightarrow_\Sigma^b \phi \in C_\Sigma(\emptyset)$, $\phi \in C_\Sigma((\phi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \phi)$.

This shows that $C_\Sigma((\phi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \phi) = C_\Sigma(\phi)$ and, hence, by self extensionality, $\langle (\phi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \phi, \phi \rangle \in \tilde{\Omega}_\Sigma(\mathcal{I})$.

(H3) By the Deduction Detachment Property with respect to $\rightarrow^b$, we get $\chi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi, (\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi))$. Thus, since $\phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\psi)$, we get $\chi \in C_\Sigma(\phi, \psi, (\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi))$. This gives $\psi \rightarrow_\Sigma^b \chi \in C_\Sigma(\phi, (\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi))$ and, hence, $\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi) \in C_\Sigma((\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi))$.

On the other hand, $\chi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi, \phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi))$. Therefore, $\phi \rightarrow_\Sigma^b \chi \in C_\Sigma(\phi \rightarrow_\Sigma^b \psi, \phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi))$, whence $(\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi) \in C_\Sigma(\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi))$.

We conclude that $C_\Sigma(\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi)) = C_\Sigma((\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi))$. Thus, by self extensionality, $\langle \phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi), (\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi) \rangle \in \tilde{\Omega}_\Sigma(\mathcal{I})$.

(H4) By the Deduction Detachment Property with respect to $\rightarrow^b$,

$$\psi \in C_\Sigma(\psi \rightarrow_\Sigma^b \phi, \phi \rightarrow_\Sigma^b \psi, (\psi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b ((\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b \phi)).$$

Therefore, $(\psi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \psi \in C_\Sigma(\phi \rightarrow_\Sigma^b \psi, (\psi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b ((\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b \phi))$, whence $(\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b ((\psi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b \psi) \in C_\Sigma((\psi \rightarrow_\Sigma^b \phi) \rightarrow_\Sigma^b ((\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b \phi))$. The other inclusion follows similarly and, then, we get the conclusion by self extensionality.

Therefore, $\{\mathcal{F}/\tilde{\Omega}(\mathcal{I})\}$ is Hilbert based with respect to $\rightarrow^b$. ■

Now we can fully characterize those finitary π -institutions which are Hilbert based.

Theorem 1759 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I}$ a finitary π -institution based on $\mathbf{F}$. $\mathcal{I}$ is Hilbert based if and only if it is self extensional and has the Uniterm Deduction Detachment Property.*

Proof: The left-to-right implication is given by Proposition 1756. Assume, conversely, that $\mathcal{I}$ is self extensional and has the Uniterm Deduction Detachment Property with respect to some $\rightarrow^b$: $(\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b . Consider $\mathbf{K} = \{\mathcal{F}/\widetilde{\Omega}(\mathcal{I})\}$. By Lemma 1758, $\mathbf{K}$ is Hilbert based with respect to $\rightarrow^b$. Let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq_f \text{SEN}^b(\Sigma)$. Then we have

$$\begin{aligned} \phi \in C_\Sigma(\Phi) & \text{ iff } \vec{\Phi} \rightarrow_\Sigma^b \phi \in C_\Sigma(\emptyset) \quad (\text{Deduction Detachment}) \\ & \text{ iff } \langle \vec{\Phi} \rightarrow_\Sigma^b \phi, \tau_\Sigma^b \rangle \in \widetilde{\lambda}_\Sigma(\mathcal{I}) \quad (\text{definition of } \widetilde{\lambda}(\mathcal{I})) \\ & \text{ iff } \langle \vec{\Phi} \rightarrow_\Sigma^b \phi, \tau_\Sigma^b \rangle \in \widetilde{\Omega}_\Sigma(\mathcal{I}). \quad (\text{self extensionality}) \end{aligned}$$

Therefore, $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}$ and, hence, by Lemma 1753, with respect to $\mathbf{K}^\mathcal{I} = \mathbb{V}^{\text{Sem}}(\mathbf{K})$, and $\rightarrow^b$. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b$: $(\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b and $\mathbf{K}$ a Hilbert based semantic variety with respect to $\rightarrow^b$. We define the *finitary* π -**institution**

$$\mathcal{I}^{\mathbf{K}, \rightarrow} = \langle \mathbf{F}, C^{\mathbf{K}, \rightarrow} \rangle,$$

associated with $\mathbf{K}$ and $\rightarrow^b$, by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq_f \text{SEN}^b(\Sigma)$,

$$\phi \in C_\Sigma^{\mathbf{K}, \rightarrow}(\Phi) \quad \text{ iff } \quad \langle \vec{\Phi} \rightarrow_\Sigma^b \phi, \tau_\Sigma^b \rangle \in \text{Ker}_\Sigma(\mathbf{K}).$$

We can see easily from the definition that $\mathcal{I}^{\mathbf{K}, \rightarrow}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$.

Corollary 1760 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b$: $(\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a Hilbert based semantic variety with respect to $\rightarrow^b$. Then $\mathcal{I}^{\mathbf{K}, \rightarrow}$ is Hilbert based with respect to $\mathbf{K}$ and $\rightarrow^b$ and, moreover, $\mathbb{V}^{\text{Sem}}(\mathcal{I}^{\mathbf{K}, \rightarrow}) = \mathbf{K}$.*

Proof: This follows directly from the definition of $\mathcal{I}^{\mathbf{K}, \rightarrow}$ and by taking into account Lemma 1753 and the definition of $\mathbb{V}^{\text{Sem}}(\mathcal{I}^{\mathbf{K}, \rightarrow})$. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b$: $(\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b . Our next goal is to establish that the two mappings

$$\begin{array}{ccc} \mathcal{I} & \xrightarrow{\quad} & \mathbb{V}^{\text{Sem}}(\mathcal{I}) \\ \mathcal{I}^{\mathbf{K}, \rightarrow} & \xleftarrow{\quad} & \mathbf{K} \end{array}$$

form a dual order isomorphism from the collection of Hilbert based π -institutions with respect to $\rightarrow^b$, under $\leq$, and Hilbert based semantic varieties with respect to $\rightarrow^b$, under $\subseteq$.

We first show that the Frege operator is both monotone and order reflecting on Hilbert based π -institutions with respect to $\rightarrow^b$.

Proposition 1761 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$, $\mathcal{I}' = \langle \mathbf{F}, C' \rangle$ be Hilbert based π -institutions with respect to $\rightarrow^b$. Then*

$$\mathcal{I} \leq \mathcal{I}' \quad \text{iff} \quad \tilde{\lambda}(\mathcal{I}) \leq \tilde{\lambda}(\mathcal{I}').$$

Proof: The left-to-right implication (monotonicity) is given by Lemma 1453. For the right-to-left implication, suppose $\tilde{\lambda}(\mathcal{I}) \leq \tilde{\lambda}(\mathcal{I}')$ and let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq_f \mathbf{SEN}^b(\Sigma)$. Then we have

$$\begin{aligned} \phi \in C_\Sigma(\Phi) & \quad \text{iff} \quad C_\Sigma(\vec{\Phi} \rightarrow_\Sigma^b \phi) = C_\Sigma(\emptyset) \quad (\text{by Theorem 1759}) \\ & \quad \text{iff} \quad \langle \vec{\Phi} \rightarrow_\Sigma^b \phi, \tau_\Sigma^b \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I}) \quad (\text{definition}) \\ & \quad \text{implies} \quad \langle \vec{\Phi} \rightarrow_\Sigma^b \phi, \tau_\Sigma^b \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I}') \quad (\text{hypothesis}) \\ & \quad \text{iff} \quad C'_\Sigma(\vec{\Phi} \rightarrow_\Sigma^b \phi) = C'_\Sigma(\emptyset) \quad (\text{definition}) \\ & \quad \text{iff} \quad \phi \in C'_\Sigma(\Phi). \quad (\text{by Theorem 1759}) \end{aligned}$$

We conclude that $\mathcal{I} \leq \mathcal{I}'$ and, hence $\tilde{\lambda}$ is also order reflecting. $\blacksquare$

Now we present the preannounced order isomorphism theorem. For an algebraic system $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$, with $\rightarrow^b$ a binary natural transformation in N^b , we let

$$\mathbf{K}^{\mathbf{F}, \rightarrow}$$

be the semantic variety consisting of all $\mathbf{F}$ -algebraic systems satisfying the Hilbert equations with respect to $\rightarrow^b$.

Theorem 1762 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b . There exists a dual order isomorphism between the collection of all Hilbert based π -institutions with respect to $\rightarrow^b$, ordered under $\leq$, and the collection of all semantic subvarieties of the semantic variety $\mathbf{K}^{\mathbf{F}, \rightarrow}$, ordered under $\subseteq$, given by $\mathcal{I} \mapsto \mathbf{K}^{\mathcal{I}}$.*

Proof: The given mapping is onto, since, by Corollary 1760, for $\mathbf{K} \subseteq \mathbf{K}^{\mathbf{F}, \rightarrow}$ a semantic subvariety of $\mathbf{K}^{\mathbf{F}, \rightarrow}$, $\mathbf{K} = \mathbf{K}^{\mathcal{I}^{\mathbf{K}, \rightarrow}}$. Moreover, it is 1-1, since $\mathbf{K}^{\mathcal{I}} = \mathbf{K}^{\mathcal{I}'}$ implies that $\tilde{\lambda}(\mathcal{I}) = \tilde{\Omega}(\mathcal{I}) = \tilde{\Omega}(\mathcal{I}') = \tilde{\lambda}(\mathcal{I}')$ and, hence, by Proposition 1761, $\mathcal{I} = \mathcal{I}'$. Finally, monotonicity and order reflectivity are both given by

$$\begin{aligned} \mathcal{I} \leq \mathcal{I}' & \quad \text{iff} \quad \tilde{\lambda}(\mathcal{I}) \leq \tilde{\lambda}(\mathcal{I}') \quad (\text{Proposition 1761}) \\ & \quad \text{iff} \quad \tilde{\Omega}(\mathcal{I}) \leq \tilde{\Omega}(\mathcal{I}') \quad (\text{Theorem 1759}) \\ & \quad \text{iff} \quad \mathcal{F}/\tilde{\Omega}(\mathcal{I}') \in \mathbf{V}^{\text{Sem}}(\mathcal{F}/\tilde{\Omega}(\mathcal{I})) \\ & \quad \text{iff} \quad \mathbf{K}^{\mathcal{I}'} \subseteq \mathbf{K}^{\mathcal{I}}. \end{aligned}$$

This establishes the order isomorphism. $\blacksquare$

Our next goal is to show that Hilbert based π -institutions, i.e., finitary self extensional π -institutions that have the Uniterm Deduction Detachment Property (by Theorem 1759) are fully self extensional.

We start by proving that on every $\mathbf{F}$ -algebraic system in the Hilbert class $\mathbf{V}^{\text{Sem}}(\mathcal{I}) = \mathbf{K}^{\mathcal{I}}$, $\mathcal{I}$ -filter families and implicative filter families coincide.

Lemma 1763 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with a binary $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution with respect to $\rightarrow^b$. For every $\mathbf{F}$ -algebraic system $\mathcal{A} \in \mathbf{K}^{\mathcal{I}}$,*

$$\text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \text{FiFam}^{\rightarrow}(\mathcal{A}).$$

Proof: Let $\mathcal{A} \in \mathbf{K}^{\mathcal{I}}$.

Suppose that $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{SEN}^b(\Sigma)$.

- We have $\phi \in C_{\Sigma}(\phi)$, whence, by Proposition 1756, $\phi \rightarrow_{\Sigma}^b \phi \in C_{\Sigma}(\emptyset)$. Hence, $\tau_{F(\Sigma)}^A \in T_{F(\Sigma)}$;
- Assume $\alpha_{\Sigma}(\phi \rightarrow_{\Sigma}^b \psi) \in T_{F(\Sigma)}$ and $\alpha_{\Sigma}(\phi) \in T_{F(\Sigma)}$. Since, again by Proposition 1756, $\psi \in C_{\Sigma}(\phi, \phi \rightarrow_{\Sigma}^b \psi)$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we get $\alpha_{\Sigma}(\psi) \in T_{F(\Sigma)}$.

Therefore, taking into account the surjectivity of $\langle F, \alpha \rangle$, $T \in \text{FiFam}^{\rightarrow}(\mathcal{A})$.

Suppose, conversely, that $T \in \text{FiFam}^{\rightarrow}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq_f \text{SEN}^b(\Sigma)$, such that $\phi \in C_{\Sigma}(\Phi)$ and $\alpha_{\Sigma}(\Phi) \subseteq T_{F(\Sigma)}$. By Proposition 1756, $\vec{\Phi} \rightarrow_{\Sigma}^b \phi \in C_{\Sigma}(\emptyset)$. Therefore, $C_{\Sigma}(\vec{\Phi} \rightarrow_{\Sigma}^b \phi) = C_{\Sigma}(\tau_{\Sigma}^b)$. Thus, by Proposition 1756 and the fact that $\mathcal{A} \in \mathbf{K}^{\mathcal{I}}$, we get that $\alpha_{\Sigma}(\vec{\Phi} \rightarrow_{\Sigma}^b \phi) = \tau_{F(\Sigma)}^A$. Since, by hypothesis, $T \in \text{FiFam}^{\rightarrow}(\mathcal{A})$, $\alpha_{\Sigma}(\vec{\Phi} \rightarrow_{\Sigma}^b \phi) \in T_{F(\Sigma)}$. Thus, by the fact that $\alpha_{\Sigma}(\Phi) \subseteq T_{F(\Sigma)}$ and $T \in \text{FiFam}^{\rightarrow}(\mathcal{A})$, we get that $\alpha_{\Sigma}(\phi) \in T_{F(\Sigma)}$. We conclude that $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$, with $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , be an algebraic system, $\mathbf{K}$ be a Hilbert based class of $\mathbf{F}$ -algebraic systems with respect to $\rightarrow^b$, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution with respect to $\mathbf{K}$ and $\rightarrow^b$. For all $\mathcal{A} \in \mathbf{K}$, all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$, define $T^{(\Sigma, \phi)} = \{T_{\Sigma'}^{(\Sigma, \phi)}\}_{\Sigma' \in |\mathbf{Sign}|}$ by setting, for all $\Sigma' \in |\mathbf{Sign}|$,

$$T_{\Sigma}^{(\Sigma, \phi)} = \{\chi \in \text{SEN}(\Sigma) : \phi \rightarrow_{\Sigma}^A \chi = \tau_{\Sigma}^A\}$$

and

$$T_{\Sigma'}^{(\Sigma, \phi)} = \{\tau_{\Sigma'}^A\}, \quad \text{for all } \Sigma' \neq \Sigma.$$

It is not difficult to see that $T^{(\Sigma, \phi)} \in \text{FiFam}^{\rightarrow}(\mathcal{A})$.

Lemma 1764 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$, with $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , be an algebraic system, $\mathbf{K}$ be a Hilbert based class of $\mathbf{F}$ -algebraic systems with respect to $\rightarrow^b$, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution with respect to $\mathbf{K}$ and $\rightarrow^b$. For all $\mathcal{A} \in \mathbf{K}$, all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$, $T^{(\Sigma, \phi)} \in \text{FiFam}^{\rightarrow}(\mathcal{A})$.*

Proof: Consider, first, $\Sigma' \neq \Sigma$. By definition, $\tau_{\Sigma'}^A \in T_{\Sigma'}^{(\Sigma, \phi)}$. Moreover, if $\tau_{\Sigma'}^A \rightarrow_{\Sigma'}^A \in T_{\Sigma'}^{(\Sigma, \phi)}$, then, by H2, $\phi \in T_{\Sigma'}^{(\Sigma, \phi)}$.

Consider, next, $\Sigma' = \Sigma$. Note that we have

$$\begin{aligned} \phi \rightarrow_{\Sigma}^A \tau_{\Sigma}^A &= \phi \rightarrow_{\Sigma}^A (\phi \rightarrow_{\Sigma}^A \phi) \quad (\text{definition}) \\ &= (\phi \rightarrow_{\Sigma}^A \phi) \rightarrow_{\Sigma}^A (\phi \rightarrow_{\Sigma}^A \phi) \quad (\text{by H3}) \\ &= \tau_{\Sigma}^A \rightarrow_{\Sigma}^A \tau_{\Sigma}^A \quad (\text{definition}) \\ &= \tau_{\Sigma}^A. \quad (\text{by H2}) \end{aligned}$$

Hence, $\tau_{\Sigma}^A \in T_{\Sigma}^{(\Sigma, \phi)}$. Moreover, if $\psi, \psi \rightarrow_{\Sigma}^A \chi \in T_{\Sigma}^{(\Sigma, \phi)}$, then, we get, by definition, $\phi \rightarrow_{\Sigma}^A \psi = \tau_{\Sigma}^A$ and $\phi \rightarrow_{\Sigma}^A (\psi \rightarrow_{\Sigma}^A \chi) \in \tau_{\Sigma}^A$. Therefore, we get

$$\begin{aligned} \phi \rightarrow_{\Sigma}^A \chi &= \tau_{\Sigma}^A \rightarrow_{\Sigma}^A (\phi \rightarrow_{\Sigma}^A \chi) \quad (\text{by H2}) \\ &= (\phi \rightarrow_{\Sigma}^A \psi) \rightarrow_{\Sigma}^A (\phi \rightarrow_{\Sigma}^A \chi) \quad (\text{hypothesis}) \\ &= \phi \rightarrow_{\Sigma}^A (\psi \rightarrow_{\Sigma}^A \chi) \quad (\text{by H3}) \\ &= \tau_{\Sigma}^A, \quad (\text{hypothesis}) \end{aligned}$$

We conclude that $\chi \in T_{\Sigma}^{(\Sigma, \phi)}$. Thus, $T^{(\Sigma, \phi)} \in \text{FiFam}^{\rightarrow}(\mathcal{A})$. ■

We can now prove that the Frege equivalence system of every full $\mathcal{I}$ -structure of the form $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle$, with $\mathcal{A} \in \mathbf{K}^{\mathcal{I}}$, is the identity congruence system. This shows, in particular that every $\mathbf{F}$ -algebraic system in $\mathbf{K}^{\mathcal{I}}$ is an $\mathcal{I}$ -algebraic system and, moreover, satisfies the Congruence Property.

Lemma 1765 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution based on $\mathbf{F}$. For every $\mathcal{A} \in \mathbf{K}^{\mathcal{I}}$, $\tilde{\lambda}^{\mathcal{I}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$. Thus, $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle$ is reduced and satisfies the Congruence Property.*

Proof: Let $\mathcal{A} \in \mathbf{K}^{\mathcal{I}}$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\langle \phi, \psi \rangle \notin \Delta_{\Sigma}^{\mathcal{A}}$. Thus, $\phi \neq \psi$. Taking into account Lemma 1764, consider $T^{(\Sigma, \phi)}, T^{(\Sigma, \psi)} \in \text{FiFam}^{\rightarrow}(\mathcal{A})$. By Lemma 1763, $T^{(\Sigma, \phi)}, T^{(\Sigma, \psi)} \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Moreover, by definition, $\phi \in T_{\Sigma}^{(\Sigma, \phi)}$ and $\psi \in T_{\Sigma}^{(\Sigma, \psi)}$. On the other hand, if it was the case that $\psi \in T_{\Sigma}^{(\Sigma, \phi)}$ and $\phi \in T_{\Sigma}^{(\Sigma, \psi)}$, then, by definition, $\phi \rightarrow_{\Sigma}^A \psi = \psi \rightarrow_{\Sigma}^A \phi = \tau_{\Sigma}^A$, whence, by Lemma 1750, $\phi = \psi$, contrary to hypothesis. Thus, it must be the case that $\psi \notin T_{\Sigma}^{(\Sigma, \phi)}$ or $\phi \notin T_{\Sigma}^{(\Sigma, \psi)}$. We can now conclude that $\langle \phi, \psi \rangle \notin \tilde{\lambda}_{\Sigma}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}))$. This shows that $\tilde{\lambda}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$. Since $\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) \leq \tilde{\lambda}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}))$, we get that $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle$ is a reduced $\mathcal{I}$ -structure and that it satisfies the Congruence Property. ■

Lemma 1765 allows us to conclude that, for Hilbert based π -institutions $\mathcal{I}$, the semantic variety of $\mathcal{I}$ coincides with the class of all $\mathcal{I}$ -algebraic systems.

Theorem 1766 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution based on $\mathbf{F}$.*

$$(a) \text{ AlgSys}(\mathcal{I}) = \mathbf{K}^{\mathcal{I}} = \mathbf{V}^{\text{Sem}}(\mathcal{I});$$

- (b) $\text{AlgSys}(\mathcal{I})$ is a semantic variety;
- (c) $\mathcal{I}$ is Hilbert based with respect to $\text{AlgSys}(\mathcal{I})$.

Proof: By Proposition 65, we have $\text{AlgSys}(\mathcal{I}) \subseteq \mathbf{K}^{\mathcal{I}}$. On the other hand, Lemma 1765 gives $\mathbf{K}^{\mathcal{I}} \subseteq \text{AlgSys}(\mathcal{I})$. Therefore, $\text{AlgSys}(\mathcal{I}) = \mathbf{K}^{\mathcal{I}}$. Since $\mathbf{K}^{\mathcal{I}}$ is a semantic variety, we conclude that $\text{AlgSys}(\mathcal{I})$ is also a semantic variety. Finally, since, by Proposition 1756, $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}^{\mathcal{I}}$, we conclude that $\mathcal{I}$ is Hilbert based with respect to $\text{AlgSys}(\mathcal{I})$. ■

In one of the main theorems of the section, we show that a finitary self extensional π -institution with the Uniterm Deduction Detachment Property is necessarily fully self extensional.

Theorem 1767 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary self extensional π -institution with the Uniterm Deduction Detachment Property. Then $\mathcal{I}$ is fully self extensional.*

Proof: Suppose that $\mathcal{I}$ is finitary self extensional and that it has the Uniterm Deduction Detachment Property with respect to $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b . By Theorem 1759 and Proposition 1756, $\mathcal{I}$ is Hilbert based with respect to $\mathbf{K}^{\mathcal{I}}$ and $\rightarrow^b$. By Theorem 1766, $\mathbf{K}^{\mathcal{I}} = \text{AlgSys}(\mathcal{I})$, whence, by Lemma 1765, for all $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$,

$$\tilde{\chi}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}.$$

Now to prove full self extensionality, we use Proposition 1465. To this end, assume $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle$ is a full $\mathcal{I}$ -structure. Then $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) \in \text{AlgSys}(\mathcal{I})$ and, by definition,

$$\text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}))) = \text{FiFam}^{\mathcal{I}}(\mathcal{A})/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})).$$

Thus, by what was shown above,

$$\tilde{\chi}^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}))}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}))) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A}))}.$$

By Proposition 1463, we infer that $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle$ also has the Congruence Property. We now conclude, by Proposition 1465, that $\mathcal{I}$ is fully self extensional. ■

We finish the section by looking at some connections with the theory of Gentzen π -institutions, that is presented in another chapter.

Recall that, given an algebraic system $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ and a finitary π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$ based on $\mathbf{F}$, a finitary Gentzen π -institution $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ is said to be **adequate for $\mathcal{I}$** if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq_f \text{SEN}^b(\Sigma)$,

$$\phi \in C_{\Sigma}(\Phi) \quad \text{iff} \quad \Phi \vdash_{\Sigma} \phi \in G_{\Sigma}(\emptyset).$$

We say that the Gentzen π -institution $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ has the **Congruence Property** if, for all $\sigma^b : (\text{SEN}^b)^k \rightarrow \text{SEN}^b$ in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\vec{\phi}, \vec{\psi} \in \text{SEN}^b(\Sigma)$,

$$\sigma_\Sigma^b(\vec{\phi}) \vdash \sigma_\Sigma^b(\vec{\psi}) \in G_\Sigma(\{\phi_i \vdash_\Sigma \psi_i, \psi_i \vdash_\Sigma \phi_i : i \in I\}).$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a finitary Gentzen π -institution based on $\mathbf{F}$. We say that:

- $\mathfrak{G}$ has the **Deduction Rule with respect to $\rightarrow^b$** , if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi, \psi\} \subseteq_f \text{SEN}^b(\Sigma)$,

$$\Phi \vdash_\Sigma \phi \rightarrow_\Sigma^b \psi \in G_\Sigma(\Phi, \phi \vdash_\Sigma \psi);$$

- $\mathfrak{G}$ has the **Detachment Rule with respect to $\rightarrow^b$** , if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi, \psi\} \subseteq_f \text{SEN}^b(\Sigma)$,

$$\Phi, \phi \vdash_\Sigma \psi \in G_\Sigma(\Phi \vdash_\Sigma \phi \rightarrow_\Sigma^b \psi);$$

- $\mathfrak{G}$ has the **Deduction Detachment Rule with respect to $\rightarrow^b$** , if it has both the Deduction and the Detachment Property with respect to $\rightarrow^b$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary self extensional π -institution, having the Deduction Detachment Property with respect to $\rightarrow^b$.

- Define $\text{Ax}^\mathcal{I} = \{\text{Ax}_\Sigma^\mathcal{I}\}_{\Sigma \in |\mathbf{Sign}^b|}$ by letting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\text{Ax}_\Sigma^\mathcal{I} = \{\Phi \vdash_\Sigma \phi : \phi \in C_\Sigma(\Phi)\};$$

- Define $\text{Ir}^\mathcal{I} = \{\text{Ir}_\Sigma^\mathcal{I}\}_{\Sigma \in |\mathbf{Sign}^b|}$ by letting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\begin{aligned} \text{Ir}_\Sigma^\mathcal{I} = & \{ \{ \{ \phi_i \vdash_\Sigma \psi_i, \psi_i \vdash_\Sigma \phi_i : i \in I \}, \sigma_\Sigma^b(\vec{\phi}) \vdash_\Sigma \sigma_\Sigma^b(\vec{\psi}) \} : \\ & \sigma^b \in N^b, \vec{\phi}, \vec{\psi} \in \text{SEN}^b(\Sigma) \} \\ & \cup \{ \{ \{ \Phi, \phi \vdash_\Sigma \psi \}, \Phi \vdash_\Sigma \phi \rightarrow_\Sigma^b \psi \} : \Phi \cup \{\phi, \psi\} \subseteq_f \text{SEN}^b(\Sigma) \} \\ & \cup \{ \{ \{ \Phi \vdash_\Sigma \phi \rightarrow_\Sigma^b \psi \}, \Phi, \phi \vdash_\Sigma \psi \} : \Phi \cup \{\phi, \psi\} \subseteq_f \text{SEN}^b(\Sigma) \}. \end{aligned}$$

- $R^\mathcal{I} := \text{Ax}^\mathcal{I} \cup \text{Ir}^\mathcal{I}$.

Finally, define $\mathfrak{G}^\mathcal{I} = \langle \mathbf{F}, C^\mathcal{I} \rangle := \mathfrak{G}^{R^\mathcal{I}}$ be the Gentzen π -institution generated by the system $R^\mathcal{I}$ of Gentzen rules. Recall, by Proposition 1519, that $G^\mathcal{I} = \Xi^{R^\mathcal{I}}$.

We are almost ready to establish the existence of a fully adequate Gentzen π -institution for any given Hilbert based π -institution. Recall, again, from work in a different chapter, that a Gentzen π -institution $\mathfrak{G}$ is **fully adequate**

for a π -institution $\mathcal{I}$ (with theorems) if, for every $\mathbf{F}$ -structure $\mathbb{L} = \langle \mathcal{A}, D \rangle$, $\mathbb{L}$ is a full $\mathcal{I}$ -structure if and only if it is a $\mathfrak{G}$ -structure.

For Hilbert based π -institutions, it turns out that any $\mathcal{I}$ -structure whose Frege equivalence system is the identity is of the form $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle$, for some $\mathcal{A} \in \mathcal{K}^{\mathcal{I}}$.

Lemma 1768 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a Hilbert based π -institution based on $\mathbf{F}$. If $\langle \mathcal{A}, D \rangle \in \text{Str}(\mathcal{I})$, such that $\tilde{\lambda}^{\mathcal{A}}(D) = \Delta^{\mathcal{A}}$, then $\mathcal{D} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and $\mathcal{A} \in \mathcal{K}^{\mathcal{I}}$.*

Proof: Let $\langle \mathcal{A}, D \rangle \in \text{Str}(\mathcal{I})$, such that $\tilde{\lambda}^{\mathcal{A}}(D) = \Delta^{\mathcal{A}}$. Then, we have

$$\tilde{\Omega}^{\mathcal{A}}(D) \leq \tilde{\lambda}^{\mathcal{A}}(D) = \Delta^{\mathcal{A}},$$

i.e., $\tilde{\Omega}^{\mathcal{A}}(D) = \Delta^{\mathcal{A}}$ and, therefore, $\mathcal{A} \in \text{AlgSys}(\mathcal{I}) \subseteq \mathcal{K}^{\mathcal{I}}$.

Suppose, next, that $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By Lemma 1763, $T \in \text{FiFam}^{\rightarrow}(\mathcal{A})$, where $\rightarrow^b$ in N^b is the binary transformation with respect to which $\mathcal{I}$ is Hilbert based. Let $\Sigma \in |\mathbf{Sign}|$, $\phi \in \text{SEN}(\Sigma)$, such that $\phi \in D_{\Sigma}(T_{\Sigma})$. By finitariness and Proposition 114, there exists $\Phi \subseteq_f T_{\Sigma}$, such that $\phi \in D_{\Sigma}(\Phi)$. Thus, by the hypothesis, Proposition 1756 and Corollary 1477, $\vec{\Phi} \rightarrow_{\Sigma}^{\mathcal{A}} \phi \in D_{\Sigma}(\tau_{\Sigma}^{\mathcal{A}})$, i.e., $D_{\Sigma}(\vec{\Phi} \rightarrow_{\Sigma}^{\mathcal{A}} \phi) = D_{\Sigma}(\tau_{\Sigma}^{\mathcal{A}})$. By hypothesis, $\vec{\Phi} \rightarrow_{\Sigma}^{\mathcal{A}} \phi = \tau_{\Sigma}^{\mathcal{A}}$. Since $T \in \text{FiFam}^{\rightarrow}(\mathcal{A})$, we have $\vec{\Phi} \rightarrow_{\Sigma}^{\mathcal{A}} \phi \in T_{\Sigma}$ and, since, also, $\Phi \subseteq T_{\Sigma}$, we infer that $\phi \in T_{\Sigma}$. Therefore, $T = D(T)$, showing that $T \in \mathcal{D}$ and, hence, $\mathcal{D} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. ■

We finally show that any Hilbert based π -institution $\mathcal{I}$ has a fully adequate Gentzen π -institution, namely, the π -institution $\mathfrak{G}^{\mathcal{I}}$, generated by the Gentzen rules $R^{\mathcal{I}}$, which encode the rules of $\mathcal{I}$, the Congruence Property and the Deduction Detachment Property.

Theorem 1769 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary π -institution based on $\mathbf{F}$, having the Uniterm Deduction Detachment Property. $\mathcal{I}$ is self extensional if and only if the Gentzen π -institution $\mathfrak{G} = \langle \mathbf{F}, G^{\mathcal{I}} \rangle$ is fully adequate for $\mathcal{I}$.*

Proof: Suppose that $\mathfrak{G}^{\mathcal{I}}$ is fully adequate for $\mathcal{I}$. We know that $\langle \mathcal{F}, C \rangle$ is a full $\mathcal{I}$ -structure. Thus, by full adequacy, $\langle \mathcal{F}, C \rangle \in \text{Str}(\mathfrak{G}^{\mathcal{I}})$. Therefore, $\langle \mathcal{F}, C \rangle$ satisfies all the Gentzen rules that hold in $\mathfrak{G}^{\mathcal{I}}$. In particular, for all σ^b in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\vec{\phi}, \vec{\psi} \subseteq \text{SEN}^b(\Sigma)$, $C_{\Sigma}(\phi_i) = C_{\Sigma}(\psi_i)$, for all $i \in I$, imply $C_{\Sigma}(\sigma_{\Sigma}^b(\vec{\phi})) = C_{\Sigma}(\sigma_{\Sigma}^b(\vec{\psi}))$. Thus, $\tilde{\lambda}(\mathcal{I})$ is a congruence system and, hence $\mathcal{I}$ is self extensional.

Suppose, conversely, that $\mathcal{I}$ is self extensional. By Theorem 1767, it is fully self extensional. Let $\langle \mathcal{A}, D \rangle \in \text{FStr}(\mathcal{I})$. Then, by Theorem 1481 and the definition of $\mathfrak{G}^{\mathcal{I}}$, we get that $\langle \mathcal{A}, D \rangle \in \text{Str}(\mathfrak{G}^{\mathcal{I}})$. Assume, conversely, that $\langle \mathcal{A}, D \rangle \in \text{Str}(\mathfrak{G}^{\mathcal{I}})$. By considering, if necessary, $\langle \mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(D), \mathcal{D}/\tilde{\Omega}^{\mathcal{A}}(D) \rangle$, we

may assume that $\tilde{\Omega}^{\mathcal{A}}(D) = \Delta^{\mathcal{A}}$ and must show that $\mathcal{D} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. By the definition of $\mathfrak{G}^{\mathcal{I}}$, we get $\langle \mathcal{A}, D \rangle \in \text{Str}(\mathcal{I})$. For the same reason, $\langle \mathcal{A}, D \rangle$ satisfies the Congruence Property. Therefore, $\tilde{\lambda}^{\mathcal{A}}(D) = \tilde{\Omega}^{\mathcal{A}}(D) = \Delta^{\mathcal{A}}$. Since, by hypothesis, it has the Deduction Detachment Property, we get, by Theorem 1759, that it is Hilbert based. Now, applying Lemma 1768, we conclude that $\mathcal{D} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Therefore, $\langle \mathcal{A}, \mathcal{D} \rangle \in \text{FStr}(\mathcal{I})$.

This shows that $\text{FStr}(\mathcal{I}) = \text{Str}(\mathfrak{G}^{\mathcal{I}})$ and, hence, $\mathfrak{G}^{\mathcal{I}}$ is, indeed, fully adequate for $\mathcal{I}$. ■

23.3 Self Extensionality and Conjunction

Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. We say that $\mathcal{I}$ has the **Conjunction Property with respect to $\wedge^b$** and that $\wedge^b$ is a **conjunction for $\mathcal{I}$** if, for all $\Sigma \in |\text{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

- $\phi \wedge_{\Sigma}^b \psi \in C_{\Sigma}(\phi, \psi)$;
- $\phi, \psi \in C_{\Sigma}(\phi \wedge_{\Sigma}^b \psi)$.

Equivalently, $\wedge^b$ is a conjunction for $\mathcal{I}$ if and only if, for all $\Sigma \in |\text{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$C_{\Sigma}(\phi \wedge_{\Sigma}^b \psi) = C_{\Sigma}(\phi, \psi).$$

We say $\mathcal{I}$ is **conjunctive** if it has the Conjunction Property with respect to some $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b .

If a π -institution has the Conjunction Property with respect to two different binary natural transformations in N^b , then the two conjunctions must be interderivable in an obvious sense.

Lemma 1770 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b, \wedge'^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ has the Conjunction Property with respect to both $\wedge^b$ and $\wedge'^b$, then, for all $\Sigma \in |\text{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,*

$$C_{\Sigma}(\phi \wedge_{\Sigma}^b \psi) = C_{\Sigma}(\phi \wedge'_{\Sigma} \psi).$$

Proof: Suppose that $\wedge^b$ and $\wedge'^b$ are both conjunctions for $\mathcal{I}$ and let $\Sigma \in |\text{Sign}^b|$, $\phi, \psi \in \text{SEN}^b(\Sigma)$. Then

$$\begin{aligned} C_{\Sigma}(\phi \wedge_{\Sigma}^b \psi) &= C_{\Sigma}(\phi, \psi) \quad (\wedge^b \text{ a conjunction}) \\ &= C_{\Sigma}(\phi \wedge'_{\Sigma} \psi). \quad (\wedge'^b \text{ a conjunction}) \end{aligned}$$

This proves the statement. ■

Corollary 1771 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b, \wedge'^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is self extensional and has the Conjunction Property with respect to both $\wedge^b$ and $\wedge'^b$, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,*

$$\langle \phi \wedge_\Sigma^b \psi, \phi \wedge'_\Sigma^b \psi \rangle \in \tilde{\Omega}_\Sigma(\mathcal{I}).$$

Proof: Suppose that $\mathcal{I}$ is self extensional and $\wedge^b$ and $\wedge'^b$ are both conjunctions for $\mathcal{I}$. Then, if $\Sigma \in |\mathbf{Sign}^b|$, $\psi, \psi \in \text{SEN}^b(\Sigma)$, by Lemma 1770, $\langle \phi \wedge_\Sigma^b \psi, \phi \wedge'_\Sigma^b \psi \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I})$, whence, by self extensionality, $\langle \phi \wedge_\Sigma^b \psi, \phi \wedge'_\Sigma^b \psi \rangle \in \tilde{\Omega}_\Sigma(\mathcal{I})$. ■

We also know, by Proposition 1471 that the Conjunction Property transfers from a π -institution $\mathcal{I}$ to all $\mathcal{I}$ -structures.

Corollary 1772 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, having the Conjunction Property with respect to $\wedge^b$. For every $\mathcal{I}$ -structure $\langle \mathcal{A}, D \rangle$, all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,*

$$D_\Sigma(\phi \wedge_\Sigma^A \psi) = D_\Sigma(\phi, \psi).$$

Proof: This is simply a restatement of Proposition 1471. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems. $\mathbf{K}$ is **semilattice based with respect to $\wedge^b$** if, for all $\mathcal{A} \in \mathbf{K}$, all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi, \chi \in \text{SEN}(\Sigma)$,

$$\text{L1. } \phi \wedge_\Sigma^A \phi = \phi;$$

$$\text{L2. } \phi \wedge_\Sigma^A \psi = \psi \wedge_\Sigma^A \phi;$$

$$\text{L3. } (\phi \wedge_\Sigma^A \psi) \wedge_\Sigma^A \chi = \phi \wedge_\Sigma^A (\psi \wedge_\Sigma^A \chi).$$

L1-L3 are referred to as the **semilattice equations**. We say that $\mathbf{K}$ is **semilattice based** if it is semilattice based with respect to some $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b .

If a class of $\mathbf{F}$ -algebraic systems is semilattices based, then the semantic variety generated by the class is also semilattice based with respect to the same binary natural transformation.

Lemma 1773 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems. If $\mathbf{K}$ is semilattice based with respect to $\wedge^b$, then $\mathbf{V}^{\text{Sem}}(\mathbf{K})$ is also semilattice based with respect to $\wedge^b$.*

Proof: Let $\mathcal{A} \in \mathbf{V}^{\text{Sem}}(\mathbf{K})$. We show $\mathcal{A}$ satisfies L2. The work for L1 and L3 follows along the same lines. Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{SEN}^b(\Sigma)$. Since $\mathbf{K}$ is semilattice based with respect to $\wedge^b$, $\langle \phi \wedge_\Sigma^b \psi, \psi \wedge_\Sigma^b \phi \rangle \in \text{Ker}_\Sigma(\mathbf{K})$. Since, by hypothesis, $\mathcal{A} \in \mathbf{V}^{\text{Sem}}(\mathbf{K})$, we get $\text{Ker}(\mathbf{K}) \leq \text{Ker}(\mathcal{A})$, whence $\langle \phi \wedge_\Sigma^b \psi, \psi \wedge_\Sigma^b \phi \rangle \in \text{Ker}_\Sigma(\mathcal{A})$. This shows that $\alpha_\Sigma(\phi \wedge_\Sigma^b \psi) = \alpha_\Sigma(\psi \wedge_\Sigma^b \phi)$, i.e., $\alpha_\Sigma(\phi) \wedge_{F(\Sigma)}^{\mathcal{A}} \alpha_\Sigma(\psi) = \alpha_\Sigma(\psi) \wedge_{F(\Sigma)}^{\mathcal{A}} \alpha_\Sigma(\phi)$. Thus, by the surjectivity of $\langle F, \alpha \rangle$, we conclude that, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$, $\phi \wedge_\Sigma^{\mathcal{A}} \psi = \psi \wedge_\Sigma^{\mathcal{A}} \phi$. Therefore, $\mathcal{A}$ satisfies L2. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a semilattice based class of $\mathbf{F}$ -algebraic systems with respect to $\wedge^b$. For every $\mathcal{A} \in \mathbf{V}^{\text{Sem}}(\mathbf{K})$, define the relation family $\leq^{\mathcal{A}} = \{\leq_\Sigma^{\mathcal{A}}\}_{\Sigma \in |\mathbf{Sign}|}$ on $\mathcal{A}$ by setting, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\phi \leq_\Sigma^{\mathcal{A}} \psi \quad \text{iff} \quad \phi \wedge_\Sigma^{\mathcal{A}} \psi = \phi.$$

It is easily shown that $\leq^{\mathcal{A}}$ is a partial order system on $\mathcal{A}$.

Lemma 1774 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a semilattice based class with respect to $\wedge^b$. For all $\mathcal{A} \in \mathbf{V}^{\text{Sem}}(\mathbf{K})$, $\leq^{\mathcal{A}}$ is a posystem on $\mathcal{A}$.*

Proof: First, fix $\mathcal{A} \in \mathbf{V}^{\text{Sem}}(\mathbf{K})$, $\Sigma \in |\mathbf{Sign}|$. We show that $\leq_\Sigma^{\mathcal{A}}$ is a partial order on $\text{SEN}(\Sigma)$. To this end, let $\phi, \psi, \chi \in \text{SEN}(\Sigma)$.

- By L1, $\phi = \phi \wedge_\Sigma^{\mathcal{A}} \phi$, whence, by definition, $\phi \leq_\Sigma^{\mathcal{A}} \phi$ and $\leq_\Sigma^{\mathcal{A}}$ is reflexive;
- If $\phi \leq_\Sigma^{\mathcal{A}} \psi$ and $\psi \leq_\Sigma^{\mathcal{A}} \phi$, then, we get

$$\begin{aligned} \phi &= \phi \wedge_\Sigma^{\mathcal{A}} \psi \quad (\phi \leq_\Sigma^{\mathcal{A}} \psi) \\ &= \psi \wedge_\Sigma^{\mathcal{A}} \phi \quad (\text{by L2}) \\ &= \psi. \quad (\psi \leq_\Sigma^{\mathcal{A}} \phi) \end{aligned}$$

Thus, $\leq_\Sigma^{\mathcal{A}}$ is antisymmetric.

- If $\phi \leq_\Sigma^{\mathcal{A}} \psi$ and $\psi \leq_\Sigma^{\mathcal{A}} \chi$, then

$$\begin{aligned} \phi &= \phi \wedge_\Sigma^{\mathcal{A}} \psi \quad (\phi \leq_\Sigma^{\mathcal{A}} \psi) \\ &= \phi \wedge_\Sigma^{\mathcal{A}} (\psi \wedge_\Sigma^{\mathcal{A}} \chi) \quad (\psi \leq_\Sigma^{\mathcal{A}} \chi) \\ &= (\phi \wedge_\Sigma^{\mathcal{A}} \psi) \wedge_\Sigma^{\mathcal{A}} \chi \quad (\text{by L3}) \\ &= \phi \wedge_\Sigma^{\mathcal{A}} \chi. \quad (\phi \leq_\Sigma^{\mathcal{A}} \psi) \end{aligned}$$

Hence $\phi \leq_\Sigma^{\mathcal{A}} \chi$ and $\leq_\Sigma^{\mathcal{A}}$ is also transitive.

Thus, $\leq^{\mathcal{A}}$ is a partial order on $\text{SEN}(\Sigma)$. Suppose, now, that $\Sigma, \Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\phi \leq_\Sigma^{\mathcal{A}} \psi$. Then, by definition, $\phi = \phi \wedge_\Sigma^{\mathcal{A}} \psi$. Thus, $\text{SEN}^b(f)(\phi) = \text{SEN}^b(f)(\phi \wedge_\Sigma^{\mathcal{A}} \psi) = \text{SEN}^b(f)(\phi) \wedge_{\Sigma'}^{\mathcal{A}} \text{SEN}^b(f)(\psi)$.

This shows that $\text{SEN}^b(f)(\phi) \leq_{\Sigma}^A \text{SEN}^b(f)(\psi)$. Thus, $\leq^A$ is a partial order system on $\mathcal{A}$. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a semilattice based class of $\mathbf{F}$ -algebraic systems with respect to $\wedge^b$, $\mathcal{A} \in \mathbf{K}$ and $T \in \text{SenFam}(\mathcal{A})$. We say that T is a **semilattice filter family** of $\mathcal{A}$ if the following conditions hold, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$:

- $T_{\Sigma} \neq \emptyset$;
- $\phi, \psi \in T_{\Sigma}$ implies $\phi \wedge_{\Sigma}^A \psi \in T_{\Sigma}$;
- $\phi \in T_{\Sigma}$ and $\phi \leq_{\Sigma}^A \psi$ imply $\psi \in T_{\Sigma}$.

We denote by $\text{FiFam}^{\wedge}(\mathcal{A})$ the collection of all semilattice filter families on $\mathcal{A}$. Moreover, we write $\text{FiFam}^{\wedge, \emptyset}(\mathcal{A})$ for the same collection augmented by those sentence families resulting from semilattice filter families after one or more components are replaced by the empty set.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a semilattice based class of $\mathbf{F}$ -algebraic systems with respect to $\wedge^b$, $\mathcal{A} \in \mathbf{K}$, $\Sigma \in |\mathbf{Sign}|$ and $\phi \in \text{SEN}(\Sigma)$. Define

$$T^{(\Sigma, \phi)} = \{T_{\Sigma'}^{(\Sigma, \phi)}\}_{\Sigma' \in |\mathbf{Sign}|}$$

by setting,

- $T_{\Sigma}^{(\Sigma, \phi)} = \{\chi \in \text{SEN}(\Sigma) : \phi \leq_{\Sigma}^A \chi\}$;
- $T_{\Sigma'}^{(\Sigma, \phi)} = \begin{cases} \{\chi \in \text{SEN}(\Sigma) : 1_{\Sigma} \leq_{\Sigma}^A \chi\}, & \text{if } 1_{\Sigma} \text{ is a maximum in } \leq_{\Sigma}^A \\ \emptyset, & \text{if } \leq_{\Sigma}^A \text{ has no maximum} \end{cases}$, for all $\Sigma \neq \Sigma' \in |\mathbf{Sign}|$,

We show that, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$, $T^{(\Sigma, \phi)} \in \text{FiFam}^{\wedge}(\mathcal{A})$ or $T^{(\Sigma, \phi)} \in \text{FiFam}^{\wedge, \emptyset}(\mathcal{A})$.

Lemma 1775 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a semilattice based class of $\mathbf{F}$ -algebraic systems with respect to $\wedge^b$, $\mathcal{A} \in \mathbf{K}$, $\Sigma \in |\mathbf{Sign}|$ and $\phi \in \text{SEN}(\Sigma)$. Then, $T^{(\Sigma, \phi)} \in \text{FiFam}^{\wedge}(\mathcal{A})$ or $T^{(\Sigma, \phi)} \in \text{FiFam}^{\wedge, \emptyset}(\mathcal{A})$.*

Proof: It suffices to show that, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$, the collection $\{\chi \in \text{SEN}(\Sigma) : \phi \leq_{\Sigma}^A \chi\}$ is an upset under $\leq_{\Sigma}^A$, closed under $\wedge_{\Sigma}^A$. Let $\psi, \chi \in \text{SEN}(\Sigma)$.

- If $\psi, \chi \in T_{\Sigma}^{(\Sigma, \phi)}$, then, by definition, $\phi \leq_{\Sigma}^A \psi$ and $\phi \leq_{\Sigma}^A \chi$. Thus, we get

$$\begin{aligned} \phi &= \phi \wedge_{\Sigma}^A \chi \quad (\phi \leq_{\Sigma}^A \chi) \\ &= (\phi \wedge_{\Sigma}^A \psi) \wedge_{\Sigma}^A \chi \quad (\phi \leq_{\Sigma}^A \psi) \\ &= \phi \wedge_{\Sigma}^A (\psi \wedge_{\Sigma}^A \chi). \quad (\text{by L3}) \end{aligned}$$

Therefore, $\phi \leq_{\Sigma}^A \psi \wedge_{\Sigma}^A \chi$ and, hence $\psi \wedge_{\Sigma}^A \chi \in T_{\Sigma}^{(\Sigma, \phi)}$.

- If $\psi \in T_{\Sigma}^{(\Sigma, \phi)}$ and $\psi \leq_{\Sigma}^{\mathcal{A}} \chi$, then $\phi \leq_{\Sigma}^{\mathcal{A}} \psi$ and $\psi \leq_{\Sigma}^{\mathcal{A}} \chi$, whence, by Lemma 1774, $\phi \leq_{\Sigma}^{\mathcal{A}} \chi$, i.e., $\chi \in T_{\Sigma}^{(\Sigma, \phi)}$.

Thus, $T^{(\Sigma, \phi)} \in \text{FiFam}^{\wedge}(\mathcal{A})$ or $T^{(\Sigma, \phi)} \in \text{FiFam}^{\wedge, \emptyset}(\mathcal{A})$. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a semilattice based class of $\mathbf{F}$ -algebraic systems with respect to $\wedge^b$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary π -institution based on $\mathbf{F}$. We say $\mathcal{I}$ is **semilattice based with respect to $\mathbf{K}$ and $\wedge^b$** if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq_f \text{SEN}^b(\Sigma)$, with $\Phi \neq \emptyset$,

$$\phi \in C_{\Sigma}(\Phi) \quad \text{iff} \quad \text{for all } \mathcal{A} \in \mathbf{K}, \\ \bigwedge_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi).$$

We say that $\mathcal{I}$ is **semilattice based** if it is semilattice based with respect to $\mathbf{K}$ and $\wedge^b$, for some semilattice based class $\mathbf{K}$ with respect to some $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b .

We get immediately from the definition that interderivability in $\mathcal{I}$ is reflected into equality in all algebraic systems in the defining class $\mathbf{K}$.

Lemma 1776 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a semilattice based class of $\mathbf{F}$ -algebraic systems with respect to $\wedge^b$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a semilattice based π -institution with respect to $\mathbf{K}$ and $\wedge^b$. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,*

$$C_{\Sigma}(\phi) = C_{\Sigma}(\psi) \quad \text{iff} \quad \text{for all } \mathcal{A} \in \mathbf{K}, \quad \alpha_{\Sigma}(\phi) = \alpha_{\Sigma}(\psi).$$

Proof: By the definition, we have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $C_{\Sigma}(\phi) = C_{\Sigma}(\psi)$ iff, for all $\mathcal{A} \in \mathbf{K}$, $\alpha_{\Sigma}(\phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\psi)$ and $\alpha_{\Sigma}(\psi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi)$ iff, by Lemma 1774, for all $\mathcal{A} \in \mathbf{K}$, $\alpha_{\Sigma}(\phi) = \alpha_{\Sigma}(\psi)$. $\blacksquare$

Moreover, in case $\mathcal{I}$ is semilattice based with respect to a class $\mathbf{K}$, then it is also semilattice based with respect to the semantic variety generated by $\mathbf{K}$, with respect to the same binary transformation.

Lemma 1777 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a semilattice based class of $\mathbf{F}$ -algebraic systems with respect to $\wedge^b$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a semilattice based π -institution with respect to $\mathbf{K}$ and $\wedge^b$. Then $\mathcal{I}$ is semilattice based with respect to $\mathbb{V}^{\text{Sem}}(\mathbf{K})$ and $\wedge^b$.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq_f \text{SEN}^b(\Sigma)$, such that $\phi \in C_{\Sigma}(\Phi)$ and $\mathcal{A} \in \mathbb{V}^{\text{Sem}}(\mathbf{K})$. Since $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}$ and $\wedge^b$, $\langle \bigwedge_{\Sigma}^b \Phi \wedge_{\Sigma}^b \phi, \bigwedge_{\Sigma}^b \Phi \rangle \in \text{Ker}_{\Sigma}(\mathbf{K})$. Since $\mathcal{A} \in \mathbb{V}^{\text{Sem}}(\mathbf{K})$, we get $\text{Ker}(\mathbf{K}) \leq \text{Ker}(\mathcal{A})$. This gives $\bigwedge_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi) \wedge_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi) = \bigwedge_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi)$, and, therefore, $\bigwedge_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi)$.

Conversely, if, for all $\mathcal{A} \in \mathbb{V}^{\text{Sem}}(\mathbf{K})$, $\bigvee_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi)$, then, a fortiori, for all $\mathcal{A} \in \mathbf{K}$, we have $\bigvee_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi)$. Therefore, by

hypothesis, $\phi \in C_\Sigma(\Phi)$. We conclude that $\mathcal{I}$ is semilattice based with respect to $\mathbb{V}^{\text{Sem}}(\mathbf{K})$ and $\wedge^b$. ■

We can now show that, if a π -institution is semilattice based with respect to two different classes of semilattice based $\mathbf{F}$ -algebraic systems, then, they both have to generate the same semantic variety.

Lemma 1778 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b, \wedge'^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , $\mathbf{K}$ a semilattice based class with respect to $\wedge^b$ and $\mathbf{K}'$ a semilattice based class with respect to $\wedge'^b$. If $\mathcal{I} = \langle \mathbf{F}, C \rangle$ is a semilattice based π -institution both with respect to $\mathbf{K}$ and $\wedge^b$ and with respect to $\mathbf{K}'$ and $\wedge'^b$, then $\mathbb{V}^{\text{Sem}}(\mathbf{K}) = \mathbb{V}^{\text{Sem}}(\mathbf{K}')$.*

Proof: Suppose $\mathcal{I} = \langle \mathbf{F}, C \rangle$ is a semilattice based π -institution both with respect to $\mathbf{K}$ and $\wedge^b$ and with respect to $\mathbf{K}'$ and $\wedge'^b$ and let $\Sigma \in |\mathbf{Sign}^b|$, $\phi, \psi \in \text{SEN}^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbf{K})$ and $\mathcal{A} \in \mathbf{K}'$. Then, since $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}$, by Lemma 1776, $C_\Sigma(\phi) = C_\Sigma(\psi)$. Thus, since $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}'$, again, by Lemma 1776, $\alpha_\Sigma(\phi) = \alpha_\Sigma(\psi)$. Hence, $\text{Ker}(\mathbf{K}) \leq \text{Ker}(\mathcal{A})$, which gives that $\mathcal{A} \in \mathbb{V}^{\text{Sem}}(\mathbf{K})$. We conclude that $\mathbf{K}' \subseteq \mathbb{V}^{\text{Sem}}(\mathbf{K})$ and, by symmetry, $\mathbb{V}^{\text{Sem}}(\mathbf{K}) = \mathbb{V}^{\text{Sem}}(\mathbf{K}')$. ■

Thus, if $\mathcal{I}$ is semilattice based with respect to some $\mathbf{K}$ and $\wedge^b$, it makes sense, based on Lemma 1778 and Lemma 1777, to denote by $\mathbb{V}^{\text{Sem}}(\mathcal{I})$ the unique semantic variety of $\mathbf{F}$ -algebraic systems with respect to which it is semilattice based.

In one of the cornerstone results of the section, we show that, if a π -institution is semilattice based, then it is self extensional and has the Conjunction Property, and, in addition, its semantic variety coincides with the semantic variety $\mathbf{K}^\mathcal{I}$ generated by the Lindenbaum-Tarski algebraic system of $\mathcal{I}$.

Proposition 1779 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b$ in N^b , $\mathbf{K}$ a semilattice based class with respect to $\wedge^b$, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a semilattice based π -institution with respect to $\mathbf{K}$ and $\wedge^b$.*

- (a) $\mathcal{I}$ is self extensional;
- (b) $\mathcal{I}$ has the Conjunction Property with respect to $\wedge^b$;
- (c) $\mathbb{V}^{\text{Sem}}(\mathcal{I}) = \mathbf{K}^\mathcal{I}$; Hence $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}^\mathcal{I}$.

Proof:

- (a) For self extensionality, it suffices to show that the Frege equivalence system $\widetilde{\lambda}(\mathcal{I})$ is a congruence system. To this end, let σ^b be in N^b , $\Sigma \in |\mathbf{Sign}^b|$ and $\vec{\phi}, \vec{\psi} \in \text{SEN}^b(\Sigma)$, such that $\langle \phi_i, \psi_i \rangle \in \widetilde{\lambda}_\Sigma(\mathcal{I})$, for all $i < k$. By definition, we get $C_\Sigma(\phi_i) = C_\Sigma(\psi_i)$, for all $i < k$. Hence, since

$\mathcal{I}$ is semilattice based with respect to $\mathbf{K}$ and $\wedge^b$, $\langle \phi_i, \psi_i \rangle \in \text{Ker}_\Sigma(\mathbf{K})$, for all $i < k$. But $\text{Ker}(\mathbf{K})$ is a congruence system on $\mathbf{F}$, whence, $\langle \sigma_\Sigma^b(\vec{\phi}), \sigma_\Sigma^b(\vec{\psi}) \rangle \in \text{Ker}_\Sigma(\mathbf{K})$. By Lemma 1776, $C_\Sigma(\sigma_\Sigma^b(\vec{\phi})) = C_\Sigma(\sigma_\Sigma^b(\vec{\psi}))$, whence $\langle \sigma_\Sigma^b(\vec{\phi}), \sigma_\Sigma^b(\vec{\psi}) \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I})$. Therefore, $\tilde{\lambda}(\mathcal{I})$ is a congruence system on $\mathbf{F}$ and $\mathcal{I}$ is self extensional.

(b) Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{SEN}^b(\Sigma)$. Then, for all $\mathcal{A} \in \mathbf{K}$,

$$\alpha_\Sigma(\phi \wedge_\Sigma^b \psi) = \alpha_\Sigma(\phi) \wedge_{F(\Sigma)}^A \alpha_\Sigma(\psi) \leq_{F(\Sigma)}^A \alpha_\Sigma(\phi), \alpha_\Sigma(\psi).$$

Thus, since $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}$ and $\wedge^b$, we get that $\phi \wedge_\Sigma^b \psi \in C_\Sigma(\phi, \psi)$ and $\phi, \psi \in C_\Sigma(\phi \wedge_\Sigma^b \psi)$. Hence, $\wedge^b$ is a conjunction for $\mathcal{I}$.

(c) We have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$\begin{aligned} \langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbb{V}^{\text{Sem}}(\mathcal{I})) & \text{ iff } \langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbb{V}^{\text{Sem}}(\mathbf{K})) \\ & \text{ (definition of } \mathbb{V}^{\text{Sem}}(\mathcal{I}) \text{)} \\ & \text{ iff } \langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbf{K}) \\ & \text{ (definition of } \mathbb{V}^{\text{Sem}}(\mathbf{K}) \text{)} \\ & \text{ iff } C_\Sigma(\phi) = C_\Sigma(\psi) \\ & \text{ (Lemma 1776)} \\ & \text{ iff } \langle \phi, \psi \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I}) \\ & \text{ (definition of } \tilde{\lambda}(\mathcal{I}) \text{)} \\ & \text{ iff } \langle \phi, \psi \rangle \in \tilde{\Omega}_\Sigma(\mathcal{I}) \\ & \text{ (Part (a))} \\ & \text{ iff } \langle \phi, \psi \rangle \in \text{Ker}_\Sigma(\mathbf{K}^\mathcal{I}). \\ & \text{ (definition of } \mathbf{K}^\mathcal{I} \text{)} \end{aligned}$$

Therefore, since both classes are semantic varieties, we conclude that $\mathbb{V}^{\text{Sem}}(\mathcal{I}) = \mathbf{K}^\mathcal{I}$. ■

If $\mathcal{I}$ is a finitary self extensional π -institution $\mathcal{I}$, having the Conjunction Property with respect to $\wedge^b$, then the singleton class $\mathbf{K} = \{\mathcal{F}/\tilde{\Omega}(\mathcal{I})\}$, consisting of its Lindenbaum-Tarski $\mathbf{F}$ -algebraic system $\mathcal{F}/\tilde{\Omega}(\mathcal{I})$, is semilattice based with respect to $\wedge^b$.

Lemma 1780 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary self extensional π -institution, having the Conjunction Property with respect to $\wedge^b$. Then the class $\mathbf{K} = \{\mathcal{F}/\tilde{\Omega}(\mathcal{I})\}$ is semilattice based with respect to $\wedge^b$.*

Proof: We have to verify that the class $\mathbf{K}$ satisfies the semilattice identities. To this end, let $\Sigma \in |\mathbf{Sign}^b|$, $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$.

- By the Conjunction Property, $C_\Sigma(\phi \wedge_\Sigma^b \phi) = C_\Sigma(\phi)$. Thus, using self extensionality, $\langle \phi \wedge_\Sigma^b \phi, \phi \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I}) = \tilde{\Omega}_\Sigma(\mathcal{I})$. Hence $\mathbf{K}$ satisfies L1.

- By the Conjunction Property, $C_\Sigma(\phi \wedge_\Sigma^b \psi) = C_\Sigma(\phi, \psi) = C_\Sigma(\psi \wedge_\Sigma^b \phi)$. Thus, again using self extensionality, $\langle \phi \wedge_\Sigma^b \psi, \psi \wedge_\Sigma^b \phi \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I}) = \tilde{\Omega}_\Sigma(\mathcal{I})$. Hence $\mathbf{K}$ satisfies L2.
- Finally, we have

$$\begin{aligned}
C_\Sigma((\phi \wedge_\Sigma^b \psi) \wedge_\Sigma^b \chi) &= C_\Sigma(\phi \wedge_\Sigma^b \psi, \chi) \\
&= C_\Sigma(\phi, \psi, \chi) \\
&= C_\Sigma(\phi, \psi \wedge_\Sigma^b \chi) \\
&= C_\Sigma(\phi \wedge_\Sigma^b (\psi \wedge_\Sigma^b \chi)).
\end{aligned}$$

Thus, again using self extensionality,

$$\langle (\phi \wedge_\Sigma^b \psi) \wedge_\Sigma^b \chi, \phi \wedge_\Sigma^b (\psi \wedge_\Sigma^b \chi) \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I}) = \tilde{\Omega}_\Sigma(\mathcal{I})$$

and $\mathbf{K}$ also satisfies L3.

Thus, $\mathbf{K}$ is semilattice based with respect to $\wedge^b$. ■

In one of our main theorems, we characterize semilattice based π -institutions as those that are self extensional and conjunctive.

Theorem 1781 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary π -institution based on $\mathbf{F}$. $\mathcal{I}$ is semilattice based if and only if it is self extensional and conjunctive.*

Proof: The left-to-right implication is by Proposition 1779. Suppose, conversely, that $\mathcal{I}$ is self extensional and conjunctive, with $\wedge^b : (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b a conjunction for $\mathcal{I}$. By Lemma 1780, $\mathbf{K} = \{\mathcal{F}/\tilde{\Omega}(\mathcal{I})\}$ is semilattice based with respect to $\wedge^b$. Moreover, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq_f \mathbf{SEN}^b(\Sigma)$,

$$\begin{aligned}
\phi \in C_\Sigma(\Phi) &\text{ iff } \phi \in C_\Sigma(\wedge_\Sigma^b \Phi) \quad (\text{Conjunction Property}) \\
&\text{ iff } C_\Sigma(\wedge_\Sigma^b \Phi \wedge_\Sigma^b \phi) = C_\Sigma(\wedge_\Sigma^b \Phi) \quad (\text{Conjunction Property}) \\
&\text{ iff } \langle \wedge_\Sigma^b \Phi \wedge_\Sigma^b \phi, \wedge_\Sigma^b \Phi \rangle \in \tilde{\lambda}_\Sigma(\mathcal{I}) \quad (\text{definition of } \tilde{\lambda}(\mathcal{I})) \\
&\text{ iff } \langle \wedge_\Sigma^b \Phi \wedge_\Sigma^b \phi, \wedge_\Sigma^b \Phi \rangle \in \tilde{\Omega}_\Sigma(\mathcal{I}) \quad (\text{self extensionality}) \\
&\text{ iff } \wedge_\Sigma^{\mathcal{F}/\tilde{\Omega}(\mathcal{I})} \Phi / \tilde{\Omega}_\Sigma(\mathcal{I}) \leq_\Sigma^{\mathcal{F}/\tilde{\Omega}(\mathcal{I})} \phi / \tilde{\Omega}_\Sigma(\mathcal{I}). \quad (\text{def. of } \leq^{\mathcal{F}/\tilde{\Omega}(\mathcal{I})})
\end{aligned}$$

Therefore, $\mathcal{I}$ is indeed semilattice based with respect to $\mathbf{K}$ and $\wedge^b$. ■

In some contexts it is desirable to have a specification of the theorems of a π -institution under discussion. However, the hypothesis that $\mathcal{I}$ is semilattice based by itself does not provide information about the theorems of $\mathcal{I}$, since it only specifies, based on properties of the defining class $\mathbf{K}$, entailments with non empty sets of hypotheses. We discuss the *property of being non pseudo-axiomatic*, which serves to streamline this ambiguity concerning theorems.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary π -institution based on $\mathbf{F}$. We say that $\mathcal{I}$ is **non pseudo-axiomatic** if, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\text{Thm}_\Sigma(\mathcal{I}) = \bigcap \{C_\Sigma(\phi) : \phi \in \mathbf{SEN}^b(\Sigma)\}.$$

The property may be equivalently expressed by the condition

$$\text{Thm}(\mathcal{I}) = \bigcap \{T \in \text{ThFam}(\mathcal{I}) : (\forall \Sigma \in |\mathbf{Sign}^b|)(T_\Sigma \neq \emptyset)\}.$$

Non pseudo-axiomatic semilattice based π -institutions form a generalization of π -institutions with theorems.

Lemma 1782 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a semilattice based π -institution with theorems, based on $\mathbf{F}$.*

(a) *$\mathcal{I}$ is non pseudo-axiomatic;*

(b) *For all $\mathcal{A} \in \mathbf{K}^\mathcal{I}$, all $\Sigma \in |\mathbf{Sign}^b|$, all $t \in \text{Thm}_\Sigma(\mathcal{I})$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$,*

$$\alpha_\Sigma(\phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_\Sigma(t).$$

Proof:

(a) Let $\Sigma \in |\mathbf{Sign}^b|$. On the one hand, $\text{Thm}_\Sigma(\mathcal{I}) \subseteq \bigcap \{C_\Sigma(\phi) : \phi \in \mathbf{SEN}^b(\Sigma)\}$. On the other, $\bigcap \{C_\Sigma(\phi) : \phi \in \mathbf{SEN}^b(\Sigma)\} \subseteq \bigcap \{C_\Sigma(\phi) : \phi \in \text{Thm}_\Sigma(\mathcal{I})\} = \text{Thm}_\Sigma(\mathcal{I})$. Hence, $\mathcal{I}$ is non pseudo-axiomatic.

(b) Suppose $\Sigma \in |\mathbf{Sign}^b|$ and $t \in \text{Thm}_\Sigma(\mathcal{I})$. Then, for all $\phi \in \mathbf{SEN}^b(\Sigma)$, $t \in C_\Sigma(\phi)$. Since, by Proposition 1779, $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}^\mathcal{I}$, we get that, for all $\mathcal{A} \in \mathbf{K}^\mathcal{I}$, $\alpha_\Sigma(\phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_\Sigma(t)$. ■

By Lemma 1776, for all $\Sigma \in |\mathbf{Sign}^b|$, and all $t, t' \in \text{Thm}_\Sigma(\mathcal{I})$, $\alpha_\Sigma(\phi) = \alpha_\Sigma(\psi)$, for all $\mathcal{A} \in \mathbf{K}$. Furthermore, the common value of all theorems in $\mathbf{SEN}(\Sigma)$ is, by Lemma 1782, a maximum element under $\leq_\Sigma^{\mathcal{A}}$. This element will be denoted by $1_\Sigma^{\mathcal{A}}$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathbf{K}$ a semilattice based semantic variety with respect to $\wedge^b$. We assume that $\mathbf{K}$ is **conditionally max natural**, i.e., for all $\mathcal{A} \in \mathbf{K}$, either for no $\Sigma \in |\mathbf{Sign}|$ is there a maximum under $\leq_\Sigma^{\mathcal{A}}$ or, for every $\Sigma \in |\mathbf{Sign}|$, there exists a maximum $1_\Sigma^{\mathcal{A}}$ under $\leq_\Sigma^{\mathcal{A}}$, and moreover, $1^{\mathcal{A}} = \{1_\Sigma^{\mathcal{A}}\}_{\Sigma \in |\mathbf{Sign}|}$ is natural, i.e., it satisfies, for all $\Sigma, \Sigma' \in |\mathbf{Sign}|$ and all $f \in \mathbf{Sign}(\Sigma, \Sigma')$,

$$\mathbf{SEN}(f)(1_\Sigma^{\mathcal{A}}) = 1_{\Sigma'}^{\mathcal{A}}.$$

Define a finitary closure system

$$C^{\mathbf{K}, \wedge} : \mathcal{P}\mathbf{SEN}^b \rightarrow \mathcal{P}\mathbf{SEN}^b$$

on $\mathbf{F}$ by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq_f \mathbf{SEN}^b(\Sigma)$,

- $\phi \in C_{\Sigma}^{\mathbf{K}, \wedge}(\emptyset)$ if and only if, for all $\mathcal{A} \in \mathbf{K}$ and all $\chi \in \text{SEN}(F(\Sigma))$, $\chi \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi)$;
- $\phi \in C_{\Sigma}^{\mathbf{K}, \wedge}(\Phi)$ if and only if, for all $\mathcal{A} \in \mathbf{K}$, $\bigwedge_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi)$.

We note that conditional max naturality is essential in guaranteeing the structurality of $C^{\mathbf{K}, \wedge}$.

Lemma 1783 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a conditionally max natural semilattice based semantic variety with respect to $\wedge^b$. Then $\mathcal{I}^{\mathbf{K}, \wedge} = \langle \mathbf{F}, C^{\mathbf{K}, \wedge} \rangle$ is a non pseudo-axiomatic π -institution.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{SEN}^b(\Sigma)$, such that $\phi \in \bigcap \{C_{\Sigma}(\psi) : \psi \in \text{SEN}^b(\Sigma)\}$. Then, by definition, for all $\mathcal{A} \in \mathbf{K}$, $\alpha_{\Sigma}(\psi) \leq \alpha_{\Sigma}(\phi)$, for all $\psi \in \text{SEN}^b(\Sigma)$. By the surjectivity of $\langle F, \alpha \rangle$, we get that $\phi \in \text{Thm}_{\Sigma}(\mathcal{I}^{\mathbf{K}, \wedge})$. Therefore, $\mathcal{I}^{\mathbf{K}, \wedge}$ is non pseudo-axiomatic. ■

The semantic variety of $\mathcal{I}^{\mathbf{K}, \wedge}$ turns out to be the class $\mathbf{K}$.

Proposition 1784 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a conditionally max natural semilattice based semantic variety with respect to $\wedge^b$. Then $\mathcal{I}^{\mathbf{K}, \wedge} = \langle \mathbf{F}, C^{\mathbf{K}, \wedge} \rangle$ is semilattice based with respect to $\mathbf{K}$ and $\wedge^b$ and $\mathbb{V}^{\text{Sem}}(\mathcal{I}^{\mathbf{K}, \wedge}) = \mathbf{K}$.*

Proof: By the second condition in the definition of $C^{\mathbf{K}, \wedge}$, we conclude that $\mathcal{I}^{\mathbf{K}, \wedge}$ is semilattice based with respect to $\mathbf{K}$ and $\wedge^b$. Then, by definition $\mathbb{V}^{\text{Sem}}(\mathcal{I}^{\mathbf{K}, \wedge}) = \mathbb{V}^{\text{Sem}}(\mathbf{K}) = \mathbf{K}$, since, by hypothesis, $\mathbf{K}$ is a semantic variety. ■

Proposition 1785 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a semilattice based non pseudo-axiomatic π -institution. Then $\mathcal{I}^{\mathbb{V}^{\text{Sem}}(\mathcal{I}), \wedge} = \mathcal{I}$.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, with $\Phi \neq \emptyset$. Then, we have:

$$\begin{aligned}
 \phi \in C_{\Sigma}^{\mathbb{V}^{\text{Sem}}(\mathcal{I}), \wedge}(\emptyset) & \text{ iff } \text{ for all } \mathcal{A} \in \mathbb{V}^{\text{Sem}}(\mathcal{I}), \chi \in \text{SEN}(F(\Sigma)), \\
 & \chi \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi), \\
 & \text{ iff } \text{ for all } \mathcal{A} \in \mathbb{V}^{\text{Sem}}(\mathcal{I}), \psi \in \text{SEN}^b(\Sigma), \\
 & \alpha_{\Sigma}(\psi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi), \\
 & \text{ iff } \text{ for all } \mathcal{A} \in \mathbf{K}, \psi \in \text{SEN}^b(\Sigma), \\
 & \alpha_{\Sigma}(\psi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi), \\
 & \text{ iff } \phi \in \bigcap \{C_{\Sigma}(\psi) : \psi \in \text{SEN}^b(\Sigma)\} \\
 & \text{ iff } \phi \in C_{\Sigma}(\emptyset).
 \end{aligned}$$

Moreover,

$$\begin{aligned}
 \phi \in C_{\Sigma}^{\mathbf{V}^{\text{Sem}}(\mathcal{I}), \wedge}(\Phi) & \text{ iff } \text{ for all } \mathcal{A} \in \mathbf{V}^{\text{Sem}}(\mathcal{I}), \\
 & \quad \wedge_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi) \\
 & \text{ iff } \text{ for all } \mathcal{A} \in \mathbf{K}, \\
 & \quad \wedge_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\Phi) \leq_{F(\Sigma)}^{\mathcal{A}} \alpha_{\Sigma}(\phi) \\
 & \text{ iff } \phi \in C_{\Sigma}(\Phi).
 \end{aligned}$$

Thus, we get $\mathcal{I}^{\mathbf{V}^{\text{Sem}}(\mathcal{I}), \wedge} = \mathcal{I}$. ■

For non pseudo-axiomatic semilattice based π -institutions on the same algebraic system, the Frege relations reflect the $\leq$ ordering on their closure systems.

Proposition 1786 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$, $\mathcal{I}' = \langle \mathbf{F}, C' \rangle$ non pseudo-axiomatic semilattice based π -institutions with respect to $\wedge^b$. Then*

$$\mathcal{I} \leq \mathcal{I}' \quad \text{iff} \quad \tilde{\lambda}(\mathcal{I}) \leq \tilde{\lambda}(\mathcal{I}').$$

Proof: The left-to-right implication is by Lemma 1453. Assume, conversely, that $\mathcal{I}, \mathcal{I}'$ are non pseudo-axiomatic semilattice based with respect to $\wedge^b$, such that $\tilde{\lambda}(\mathcal{I}) \leq \tilde{\lambda}(\mathcal{I}')$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq_f \mathbf{SEN}^b(\Sigma)$, with $\Phi \neq \emptyset$,

$$\begin{aligned}
 \phi \in C_{\Sigma}(\Phi) & \quad \text{iff} \quad \phi \in C_{\Sigma}(\wedge_{\Sigma}^b \Phi) \\
 & \quad \text{iff} \quad C_{\Sigma}(\wedge_{\Sigma}^b \Phi \wedge_{\Sigma}^b \phi) = C_{\Sigma}(\wedge_{\Sigma}^b \Phi) \\
 & \quad \text{iff} \quad \langle \wedge_{\Sigma}^b \Phi \wedge_{\Sigma}^b \phi, \wedge_{\Sigma}^b \Phi \rangle \in \tilde{\lambda}_{\Sigma}(\mathcal{I}) \\
 & \text{implies} \quad \langle \wedge_{\Sigma}^b \Phi \wedge_{\Sigma}^b \phi, \wedge_{\Sigma}^b \Phi \rangle \in \tilde{\lambda}_{\Sigma}(\mathcal{I}') \\
 & \quad \text{iff} \quad C'_{\Sigma}(\wedge_{\Sigma}^b \Phi \wedge_{\Sigma}^b \phi) = C'_{\Sigma}(\wedge_{\Sigma}^b \Phi) \\
 & \quad \text{iff} \quad \phi \in C'_{\Sigma}(\wedge_{\Sigma}^b \Phi) \\
 & \quad \text{iff} \quad \phi \in C'_{\Sigma}(\Phi).
 \end{aligned}$$

Moreover, taking into account what was just demonstrated,

$$\begin{aligned}
 \phi \in C_{\Sigma}(\emptyset) & \quad \text{iff} \quad \phi \in \bigcap \{C_{\Sigma}(\psi) : \psi \in \mathbf{SEN}^b(\Sigma)\} \\
 & \text{implies} \quad \phi \in \bigcap \{C'_{\Sigma}(\psi) : \psi \in \mathbf{SEN}^b(\Sigma)\} \\
 & \quad \text{iff} \quad \phi \in C'_{\Sigma}(\emptyset).
 \end{aligned}$$

We conclude that $\mathcal{I} \leq \mathcal{I}'$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b . Denote by $\mathbf{K}^{\mathbf{F}, \wedge}$ the semantic variety of $\mathbf{F}$ -algebraic systems generated by the semilattice equations L1-L4.

Theorem 1787 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b . There exists a dual isomorphism between the collection of semilattice based non pseudo-axiomatic π -institutions with respect to $\wedge^b$ flat, ordered under $\leq$, and the collection of all conditionally maximal natural semantic subvarieties of $\mathbf{K}^{\mathbf{F}, \wedge}$, ordered under $\sqsubseteq$, given by $\mathcal{I} \mapsto \mathbf{K}^{\mathcal{I}}$.*

Proof: Consider the mapping $\mathcal{I} \mapsto \mathbf{K}^{\mathcal{I}}$.

Suppose, first, that $\mathcal{I}, \mathcal{I}'$ are non pseudo-axiomatic and semilattice based with respect to $\wedge^b$, such that $\mathbf{K}^{\mathcal{I}} = \mathbf{K}^{\mathcal{I}'}$. Then $\mathcal{I}^{\mathbf{K}^{\mathcal{I}}, \wedge} = \mathcal{I}^{\mathbf{K}^{\mathcal{I}'}, \wedge}$. By Proposition 1779 and Proposition 1785, we get $\mathcal{I} = \mathcal{I}'$. Therefore, the mapping is one-to-one.

Assume, now, that $\mathbf{K}$ is conditionally max natural and semilattice based with respect to $\wedge^b$. Then, by Lemma 1783 and Proposition 1784, $\mathcal{I}^{\mathbf{K}, \wedge}$ is a non pseudo-axiomatic and semilattice based π -institution with respect to $\mathbf{K}$ and $\wedge^b$, such that $\mathbf{V}^{\text{Sem}}(\mathcal{I}^{\mathbf{K}, \wedge}) = \mathbf{K}$. Therefore, by Proposition 1779, $\mathbf{K}^{\mathcal{I}^{\mathbf{K}, \wedge}} = \mathbf{K}$ and the mapping is also onto. Thus, it is a bijection from the collection of semilattice based non pseudo-axiomatic π -institutions with respect to $\wedge^{\text{flat}}$ onto the collection of all conditionally max natural semantic subvarieties of $\mathbf{K}^{\mathbf{F}, \wedge}$.

Finally, for all non pseudo-axiomatic and semilattice based π -institutions $\mathcal{I}, \mathcal{I}'$, with respect to $\wedge^b$, we have

$$\begin{aligned} \mathcal{I} \leq \mathcal{I}' & \text{ iff } \widetilde{\lambda}(\mathcal{I}) \leq \widetilde{\lambda}(\mathcal{I}') \quad (\text{by Proposition 1786}) \\ & \text{ iff } \widetilde{\Omega}(\mathcal{I}) \leq \widetilde{\Omega}(\mathcal{I}') \quad (\text{by Proposition 1779}) \\ & \text{ iff } \mathbf{K}^{\mathcal{I}'} \leq \mathbf{K}^{\mathcal{I}}. \quad (\text{definition of } \mathbf{K}^{\mathcal{I}}, \mathbf{K}^{\mathcal{I}'}) \end{aligned}$$

Thus, the bijection is also order reversing and dual order reflecting and, therefore, it is a dual order isomorphism, as claimed. $\blacksquare$

Our next goal is to show that for semilattice based π -institutions, their semantic variety coincides with the class of all $\mathcal{I}$ -algebraic systems. We start by showing that, for such a π -institution, the $\mathcal{I}$ -filter families on any algebraic system in their semantic variety coincides (roughly) with the collection of all semilattice filter families.

Lemma 1788 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a semilattice based π -institution based on $\mathbf{F}$. For all $\mathcal{A} \in \mathbf{K}^{\mathcal{I}}$,*

$$\text{FiFam}^{\mathcal{I}}(\mathcal{A}) = \begin{cases} \text{FiFam}^{\wedge}(\mathcal{A}), & \text{if } \mathcal{I} \text{ has theorems} \\ \text{FiFam}^{\wedge, \emptyset}(\mathcal{A}), & \text{otherwise} \end{cases}$$

Proof: It suffices to show that, for all $T \in \text{SenFam}(\mathcal{A})$, such that $T_{\Sigma} \neq \emptyset$, for all $\Sigma \in |\mathbf{Sign}|$, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ if and only if $T \in \text{FiFam}^{\wedge}(\mathcal{A})$.

Suppose, first, that $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$.

- Suppose that $\alpha_{\Sigma}(\phi), \alpha_{\Sigma}(\psi) \in T_{F(\Sigma)}$. Then, since $\phi \wedge_{\Sigma}^b \psi \in C_{\Sigma}(\phi, \psi)$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we get $\alpha_{\Sigma}(\phi) \wedge_{F(\Sigma)}^A \alpha_{\Sigma}(\psi) = \alpha_{\Sigma}(\phi \wedge_{\Sigma}^b \psi) \in T_{F(\Sigma)}$;
- If $\alpha_{\Sigma}(\phi) \in T_{F(\Sigma)}$ and $\alpha_{\Sigma}(\phi) \leq_{F(\Sigma)}^A \alpha_{\Sigma}(\psi)$, then $\alpha_{\Sigma}(\phi \wedge_{\Sigma}^b \psi) = \alpha_{\Sigma}(\phi) \wedge_{F(\Sigma)}^A \alpha_{\Sigma}(\psi) = \alpha_{\Sigma}(\phi) \in T_{F(\Sigma)}$. Since $\psi \in C_{\Sigma}(\phi \wedge_{\Sigma}^b \psi)$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we get $\alpha_{\Sigma}(\psi) \in T_{F(\Sigma)}$.

Taking into account the surjectivity of $\langle F, \alpha \rangle$, we get $T \in \text{FiFam}^\wedge(\mathcal{A})$.

Assume, conversely, that $T \in \text{FiFam}^\wedge(\mathcal{A})$ and let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq_f \text{SEN}^b(\Sigma)$, such that $\phi \in C_\Sigma(\Phi)$ and $\alpha_\Sigma(\Phi) \subseteq T_{F(\Sigma)}$. Since, by Proposition 1779, $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}^\mathcal{I}$, we get that $\bigwedge_{F(\Sigma)}^A \alpha_\Sigma(\Phi) \leq_{F(\Sigma)}^A \alpha_\Sigma(\phi)$ and $\alpha_\Sigma(\Phi) \subseteq T_{F(\Sigma)}$. Since, by hypothesis, $T \in \text{FiFam}^\wedge(\mathcal{A})$, $\alpha_\Sigma(\phi) \in T_{F(\Sigma)}$.

Finally, if $\phi \in C_\Sigma(\emptyset)$, then $\phi \in C_\Sigma(\psi)$, for all $\psi \in \text{SEN}^b(\Sigma)$. Since $\mathcal{I}$ has theorems, $T_{F(\Sigma)} \neq \emptyset$, whence, by the surjectivity of $\langle F, \alpha \rangle$, for some $\psi \in \text{SEN}^b(\Sigma)$, $\alpha_\Sigma(\psi) \in T_{F(\Sigma)}$. For this chosen ψ , we also have, since $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}^\mathcal{I}$, that $\alpha_\Sigma(\psi) \leq_{F(\Sigma)}^A \alpha_\Sigma(\phi)$. Thus, since $T \in \text{FiFam}^\wedge(\mathcal{A})$, we conclude that $\alpha_\Sigma(\phi) \in T_{F(\Sigma)}$.

Since in all cases $\phi \in C_\Sigma(\Phi)$ and $\alpha_\Sigma(\Phi) \subseteq T_{F(\Sigma)}$ imply $\alpha_\Sigma(\phi) \in T_{F(\Sigma)}$, $T \in \text{FiFam}^\mathcal{I}(\mathcal{A})$. ■

In the next step, we show that, for a semilattice based π -institution, the Frege congruence system of any $\mathcal{I}$ -structure of the form $\langle \mathcal{A}, \text{FiFam}^\mathcal{I}(\mathcal{A}) \rangle$, with $\mathcal{A}$ in the semantic variety of $\mathcal{I}$, is reduced.

Lemma 1789 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a semilattice based π -institution based on $\mathbf{F}$. For every $\mathcal{A} \in \mathbf{K}^\mathcal{I}$,*

$$\tilde{\lambda}^{\mathcal{A}}(\text{FiFam}^\mathcal{I}(\mathcal{A})) = \Delta^{\mathcal{A}}.$$

Hence, $\langle \mathcal{A}, \text{FiFam}^\mathcal{I}(\mathcal{A}) \rangle$ is reduced.

Proof: Let $\mathcal{A} \in \mathbf{K}^\mathcal{I}$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\langle \phi, \psi \rangle \notin \Delta_\Sigma^{\mathcal{A}}$. Then, by definition, $\phi \neq \psi$ and, by Lemma 1774 and Proposition 1779, we get $\psi \notin T_\Sigma^{(\Sigma, \phi)}$ or $\phi \in T_\Sigma^{(\Sigma, \psi)}$. Since, by Lemmas 1775 and 1788, $T^{(\Sigma, \phi)}, T^{(\Sigma, \psi)} \in \text{FiFam}^\mathcal{I}(\mathcal{A})$, we get that $\langle \phi, \psi \rangle \notin \tilde{\lambda}^{\mathcal{A}}(\text{FiFam}^\mathcal{I}(\mathcal{A}))$. Thus, $\tilde{\lambda}^{\mathcal{A}}(\text{FiFam}^\mathcal{I}(\mathcal{A})) = \Delta^{\mathcal{A}}$.

Finally, $\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^\mathcal{I}(\mathcal{A})) \leq \tilde{\lambda}^{\mathcal{A}}(\text{FiFam}^\mathcal{I}(\mathcal{A}))$, whence, $\tilde{\Omega}^{\mathcal{A}}(\text{FiFam}^\mathcal{I}(\mathcal{A})) = \Delta^{\mathcal{A}}$ and, therefore, $\langle \mathcal{A}, \text{FiFam}^\mathcal{I}(\mathcal{A}) \rangle$ is a reduced $\mathcal{I}$ -structure. ■

In the last step before the main theorem, we show that for a semilattice based π -institution $\mathcal{I}$, if $\langle \mathcal{A}, D \rangle$ is any $\mathcal{I}$ -structure, such that $\tilde{\lambda}^{\mathcal{A}}(D) = \Delta^{\mathcal{A}}$, then $\mathcal{D}$ is either $\text{FiFam}^\mathcal{I}(\mathcal{A})$, if $\mathcal{I}$ has theorems, or $\mathcal{D}^\emptyset$ is $\text{FiFam}^\mathcal{I}(\mathcal{A})$, if $\mathcal{I}$ does not have theorems, where $\mathcal{D}^\emptyset$ consists of the filter families in $\mathcal{D}$, (potentially) augmented by filter families in $\mathcal{D}$, in which one or more components have been replaced by $\emptyset$.

Lemma 1790 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a semilattice based π -institution based on $\mathbf{F}$, and $\langle \mathcal{A}, D \rangle \in \text{Str}(\mathcal{I})$, such that $\tilde{\lambda}^{\mathcal{A}}(D) = \Delta^{\mathcal{A}}$. If $\mathcal{I}$ has theorems, then $\mathcal{D} = \text{FiFam}^\mathcal{I}(\mathcal{A})$. If $\mathcal{I}$ does not have theorems, then $\mathcal{D}^\emptyset = \text{FiFam}^\mathcal{I}(\mathcal{A})$.*

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and suppose $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, with $T_{\Sigma} \neq \emptyset$, for all $\Sigma \in |\mathbf{Sign}|$. Let $\Sigma \in |\mathbf{Sign}|$, $\phi \in \text{SEN}(\Sigma)$, such that $\phi \in D_{\Sigma}(T_{\Sigma})$. By Proposition 114, there exists $\Phi \subseteq_f T_{\Sigma}$, such that $\phi \in D_{\Sigma}(\Phi)$. Since $\langle \mathcal{A}, D \rangle \in \text{Str}(\mathcal{I})$, by Corollary 1772, $D_{\Sigma}(\bigwedge_{\Sigma}^{\mathcal{A}} \Phi \wedge_{\Sigma}^{\mathcal{A}} \phi) = D_{\Sigma}(\bigwedge_{\Sigma}^{\mathcal{A}} \Phi)$. Hence, by hypothesis, $\bigwedge_{\Sigma}^{\mathcal{A}} \Phi \wedge_{\Sigma}^{\mathcal{A}} \phi = \bigwedge_{\Sigma}^{\mathcal{A}} \Phi$. Since $\Phi \subseteq_f T_{\Sigma}$ and, by Lemma 1788, $T \in \text{FiFam}^{\wedge}(\mathcal{A})$, $\bigwedge_{\Sigma}^{\mathcal{A}} \Phi \in T_{\Sigma}$. By the preceding equation, $\bigwedge_{\Sigma}^{\mathcal{A}} \Phi \wedge_{\Sigma}^{\mathcal{A}} \phi \in T_{\Sigma}$ and, therefore, $\phi \in T_{\Sigma}$. We conclude that $T = D(T)$ and, hence, $T \in \mathcal{D}$.

If $\mathcal{I}$ has theorems, then, for every $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T_{\Sigma} \neq \emptyset$, for all $\Sigma \in |\mathbf{Sign}|$. By what was proven above, $\mathcal{D} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. On the other hand, if $\mathcal{I}$ does not have theorems, then any of the components of $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ is allowed to be empty and, therefore, $\mathcal{D}^{\emptyset} = \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. ■

In one of the main theorems, we show that, for a semilattice based π -institution $\mathcal{I}$, the semantic variety $\mathbf{K}^{\mathcal{I}}$ of $\mathcal{I}$ coincides with the class $\text{AlgSys}(\mathcal{I})$ of all $\mathcal{I}$ -algebraic systems.

Theorem 1791 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a semilattice based π -institution based on $\mathbf{F}$.*

- (a) $\text{AlgSys}(\mathcal{I}) = \mathbf{K}^{\mathcal{I}}$;
- (b) $\text{AlgSys}(\mathcal{I})$ is a semantic variety;
- (c) $\mathcal{I}$ is semilattice based with respect to $\text{AlgSys}(\mathcal{I})$.

Proof: We have, by Proposition 65, that, in general, $\text{AlgSys}(\mathcal{I}) \subseteq \mathbf{K}^{\mathcal{I}}$. Suppose, conversely, that $\mathcal{A} \in \mathbf{K}^{\mathcal{I}}$. Then, by Lemma 1789, $\langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle$ is reduced. Therefore, $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$. We conclude that $\text{AlgSys}(\mathcal{I}) = \mathbf{K}^{\mathcal{I}}$. Since $\mathbf{K}^{\mathcal{I}}$ is, by definition, a semantic variety, then so is $\text{AlgSys}(\mathcal{I})$. Finally, since, by Proposition 1779, $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}^{\mathcal{I}}$, it is semilattice based with respect to $\text{AlgSys}(\mathcal{I})$. ■

In another main theorem, it is shown that a finitary self extensional and conjunctive π -institution $\mathcal{I}$ is necessarily fully self extensional, i.e., that every $\langle \mathcal{A}, D \rangle \in \text{FStr}(\mathcal{I})$ satisfies the Congruence Property.

Theorem 1792 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is self extensional and conjunctive, then it is fully self extensional.*

Proof: Suppose that $\mathcal{I}$ is finitary, self extensional and has the Conjunction Property with respect to $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b . By Theorem 1781 and Proposition 1779, $\mathcal{I}$ is semilattice based with respect to $\mathbf{K}^{\mathcal{I}}$ and $\wedge^b$. By Proposition 65, $\text{AlgSys}(\mathcal{I}) \subseteq \mathbf{K}^{\mathcal{I}}$, whence, by Lemma 1789, if $\mathcal{A} \in \text{AlgSys}(\mathcal{I})$, then $\tilde{\lambda}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \Delta^{\mathcal{A}}$.

Suppose, now, that $\langle \mathcal{A}, D \rangle \in \text{FStr}(\mathcal{I})$. Then, by definition,

$$\text{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(D)) = \mathcal{D}/\tilde{\Omega}^{\mathcal{A}}(D).$$

Since $\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) \in \text{AlgSys}(\mathcal{I})$, by what was shown in the preceding paragraph,

$$\tilde{\chi}^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{D})}(\mathcal{D}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{D})) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{D})}.$$

Therefore, we get that $\langle \mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{D}), \mathcal{D}/\tilde{\Omega}^{\mathcal{A}}(\mathcal{D}) \rangle$ has the Congruence Property. Therefore, by Proposition 1463, $\langle \mathcal{A}, \mathcal{D} \rangle$ also has the Congruence Property. We conclude that $\mathcal{I}$ is fully self extensional. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a finitary Gentzen π -institution based on $\mathbf{F}$.

$\mathfrak{G}$ has congruence if, for all σ^b in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\vec{\phi}, \vec{\psi} \in \text{SEN}^b(\Sigma)$,

$$\sigma_{\Sigma}^b(\vec{\phi}) \vdash_{\Sigma} \sigma_{\Sigma}^b(\vec{\psi}) \in G_{\Sigma}(\{\phi_i \vdash_{\Sigma} \psi_i, \psi_i \vdash_{\Sigma} \phi_i : i < k\}).$$

Moreover, $\mathfrak{G}$ has conjunction with respect to $\wedge^b$ if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$\phi, \psi \vdash_{\Sigma} \phi \wedge_{\Sigma}^b \psi, \phi \wedge_{\Sigma}^b \psi \vdash_{\Sigma} \phi, \phi \wedge_{\Sigma}^b \psi \vdash_{\Sigma} \psi \in G_{\Sigma}(\emptyset).$$

Let, also, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a finitary π -institutuon based on $\mathbf{F}$. Recall that:

- If $\mathcal{I}$ has theorems, $\mathfrak{G}$ is **fully adequate for $\mathcal{I}$** if $\text{Str}(\mathfrak{G}) = \text{FStr}(\mathcal{I})$;
- If $\mathcal{I}$ does not have theorems, then $\mathfrak{G}$ is **fully adequate for $\mathcal{I}$** if $\text{Str}(\mathfrak{G})^{\emptyset} = \text{FStr}(\mathcal{I})$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\wedge^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary self extensional π -institution, having the Conjunction Property with respect to $\wedge^b$.

- Define $\text{Ax}^{\mathcal{I}} = \{\text{Ax}_{\Sigma}^{\mathcal{I}}\}_{\Sigma \in |\mathbf{Sign}^b|}$ by letting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\text{Ax}_{\Sigma}^{\mathcal{I}} = \{\Phi \vdash_{\Sigma} \phi : \phi \in C_{\Sigma}(\Phi)\};$$

- Define $\text{Ir}^{\mathcal{I}} = \{\text{Ir}_{\Sigma}^{\mathcal{I}}\}_{\Sigma \in |\mathbf{Sign}^b|}$ by letting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\begin{aligned} \text{Ir}_{\Sigma}^{\mathcal{I}} = \{ \{ \{ \phi_i \vdash_{\Sigma} \psi_i, \psi_i \vdash_{\Sigma} \phi_i : i \in I \}, \sigma_{\Sigma}^b(\vec{\phi}) \vdash_{\Sigma} \sigma_{\Sigma}^b(\vec{\psi}) \} : \\ \sigma^b \in N^b, \vec{\phi}, \vec{\psi} \in \text{SEN}^b(\Sigma) \}. \end{aligned}$$

- $R^{\mathcal{I}} := \text{Ax}^{\mathcal{I}} \cup \text{Ir}^{\mathcal{I}}$.

Finally, define $\mathfrak{G}^{\mathcal{I}} = \langle \mathbf{F}, C^{\mathcal{I}} \rangle := \mathfrak{G}^{R^{\mathcal{I}}}$ as the Gentzen π -institution generated by the system $R^{\mathcal{I}}$ of Gentzen rules. Recall, by Proposition 1519, that $G^{\mathcal{I}} = \Xi^{R^{\mathcal{I}}}$.

This Gentzen π -institution turns out to be fully adequate for the π -institution $\mathcal{I}$:

Theorem 1793 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary conjunctive π -institution. $\mathcal{I}$ is self extensional if and only if $\mathfrak{G}^{\mathcal{I}} = \langle \mathbf{F}, G^{\mathcal{I}} \rangle$ is fully adequate for $\mathcal{I}$.*

Proof: Suppose, first, that $\mathfrak{G}$ is fully adequate for $\mathcal{I}$. Since $\langle \mathcal{F}, C \rangle \in \mathbf{FStr}(\mathcal{I})$, we get that $\langle \mathcal{F}, C \rangle \in \mathbf{Str}(\mathfrak{G}^{\mathcal{I}})$, if $\mathcal{I}$ has theorems, and that $\langle \mathcal{F}, C \rangle \in \mathbf{Str}(\mathfrak{G}^{\mathcal{I}})^\emptyset$, otherwise. Since, by definition, $\mathfrak{G}^{\mathcal{I}}$ has congruence, we get that $\langle \mathcal{F}, C \rangle$ has the Congruence Property, which amounts to $\mathcal{I}$ having the Congruence Property. Thus, $\mathcal{I}$ is self extensional.

Assume, conversely, that $\mathcal{I}$ is finitary, self extensional and has the Conjunction Property with respect to $\wedge^b : (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b .

- Suppose, first, that $\langle \mathcal{A}, D \rangle \in \mathbf{FStr}(\mathcal{I})$. Then, by Theorem 1792, $\langle \mathcal{A}, D \rangle$ has the Congruence Property. Moreover, by definition, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq_f \mathbf{SEN}^b(\Sigma)$, if $\phi \in C_\Sigma(\Phi)$, then, $\alpha_\Sigma(\phi) \in D_{F(\Sigma)}(\alpha_\Sigma(\Phi))$. We conclude that, if $\mathcal{I}$ has theorems, then $\langle \mathcal{A}, D \rangle \in \mathbf{Str}(\mathfrak{G}^{\mathcal{I}})$ and that, otherwise, $\langle \mathcal{A}, D \rangle \in \mathbf{Str}(\mathfrak{G}^{\mathcal{I}})^\emptyset$.
- Suppose, conversely, that $\langle \mathcal{A}, D \rangle \in \mathbf{Str}(\mathfrak{G}^{\mathcal{I}})$, if $\mathcal{I}$ has theorems, or $\langle \mathcal{A}, D \rangle \in \mathbf{Str}(\mathfrak{G}^{\mathcal{I}})^\emptyset$, otherwise. Consider the reduction

$$\langle \mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})), \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})/\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})) \rangle.$$

This reduction is an $\mathcal{I}$ -structure and, by hypothesis and Proposition 1463, it has the Congruence Property. Thus, we get

$$\tilde{\lambda}^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}))}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})/\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}))) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}))}.$$

Now Lemma 1790 allows us to conclude that

$$\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})/\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})) = \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}/\tilde{\Omega}^{\mathcal{A}}(\mathbf{FiFam}^{\mathcal{I}}(\mathcal{A}))).$$

Therefore, $\langle \mathcal{A}, D \rangle \in \mathbf{FStr}(\mathcal{I})$.

We conclude that $\mathfrak{G}^{\mathcal{I}}$ is fully adequate for $\mathcal{I}$. ■

23.4 Fregeanity

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with a binary natural transformation $\rightarrow^b : (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.

Recall that $\mathcal{I}$ is called:

- **strongly Fregean** if, for every $T \in \mathbf{ThFam}(\mathcal{I})$, $\tilde{\lambda}(T) = \tilde{\Omega}(T)$, i.e., if and only if the strong Frege equivalence family $\tilde{\lambda}(T)$ is a congruence system;

- **congruential** if, for every $T \in \text{ThFam}(\mathcal{I})$, $\tilde{\lambda}(T)$ satisfies the congruence property, i.e., $\tilde{\lambda}(T)$ is a congruence family (but not necessarily a system);
- **Fregean** if, for every $T \in \text{ThFam}(\mathcal{I})$, $\tilde{\Lambda}(T) = \tilde{\Omega}(T)$, i.e., if its Frege equivalence system $\tilde{\Lambda}$ is a congruence system.

Strong Fregeanity implies congruentiality, which, in turn, implies Fregeanity.

Recall, also, that $\mathcal{I}$ is said to have the **Deduction Detachment Theorem with respect to $\rightarrow^b$** if, for every $\Sigma \in |\mathbf{Sign}^b|$, all $\Phi \cup \{\phi, \psi\} \subseteq \text{SEN}^b(\Sigma)$,

$$\psi \in C_\Sigma(\Phi, \phi) \quad \text{iff} \quad \phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\Phi).$$

In the following proposition, it is shown that every strongly Fregean π -institution with the Deduction Detachment Theorem satisfies certain axioms and the rule of Modus Ponens.

Proposition 1794 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with a binary natural transformation $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a congruential π -institution having the Deduction Detachment Theorem with respect to $\rightarrow^b$. Then, for all σ^b in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi, \vec{\phi}, \vec{\psi} \in \text{SEN}^b(\Sigma)$,*

- (a) $\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \phi) \in C_\Sigma(\emptyset)$;
- (b) $(\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi)) \rightarrow_\Sigma^b ((\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi)) \in C_\Sigma(\emptyset)$;
- (c) $(\phi_0 \rightarrow_\Sigma^b \psi_0) \rightarrow_\Sigma^b ((\psi_0 \rightarrow_\Sigma^b \phi_0) \rightarrow_\Sigma^b (\dots((\phi_{k-1} \rightarrow_\Sigma^b \psi_{k-1}) \rightarrow_\Sigma^b ((\psi_{k-1} \rightarrow_\Sigma^b \phi_{k-1}) \rightarrow_\Sigma^b (\sigma_\Sigma^b(\vec{\phi}) \rightarrow_\Sigma^b \sigma_\Sigma^b(\vec{\psi})))))) \in C_\Sigma(\emptyset)$;
- (d) $\psi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi)$.

Proof:

- (a) We have, by inflationarity, $\phi \in C_\Sigma(\phi, \psi)$, whence, by two applications of the Deduction Theorem, $\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \phi) \in C_\Sigma(\emptyset)$.
- (b) We have, using the Detachment Theorem,

$$\chi \in C_\Sigma(\psi, \psi \rightarrow_\Sigma^b \chi) \subseteq C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi, \phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi)).$$

Thus, using the Deduction Theorem, we get

$$(\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi)) \rightarrow_\Sigma^b ((\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi)) \in C_\Sigma(\emptyset).$$

(c) Since $\mathcal{I}$ is congruential, we get, for all $T \in \text{ThFam}(\mathcal{I})$,

$$C_\Sigma(T_\Sigma, \phi_i) = C_\Sigma(T_\Sigma, \psi_i), \quad i < k,$$

$$\text{imply } C_\Sigma(T_\Sigma, \sigma_\Sigma^b(\vec{\phi})) = C_\Sigma(T_\Sigma, \sigma_\Sigma^b(\vec{\psi})).$$

But $C_\Sigma(T_\Sigma, \phi_i) = C_\Sigma(T_\Sigma, \psi_i)$ is equivalent, by the Deduction Detachment Theorem, to $\phi \rightarrow_\Sigma^b \psi$, $\psi \rightarrow_\Sigma^b \phi \in C_\Sigma(T_\Sigma) = T_\Sigma$. Similarly,

$$C_\Sigma(T_\Sigma, \sigma_\Sigma^b(\vec{\phi})) = C_\Sigma(T_\Sigma, \sigma_\Sigma^b(\vec{\psi}))$$

is equivalent to $\sigma_\Sigma^b(\vec{\phi}) \rightarrow_\Sigma^b \sigma_\Sigma^b(\vec{\psi})$, $\sigma_\Sigma^b(\vec{\psi}) \rightarrow_\Sigma^b \sigma_\Sigma^b(\vec{\phi}) \in C_\Sigma(T_\Sigma) = T_\Sigma$. Therefore, we get

$$\sigma_\Sigma^b(\vec{\phi}) \rightarrow_\Sigma^b \sigma_\Sigma^b(\vec{\psi}) \in C_\Sigma(\{\phi_i \rightarrow_\Sigma^b \psi_i, \psi_i \rightarrow_\Sigma^b \phi_i : i < k\}).$$

Now (c) follows by several applications of the Deduction Theorem.

(d) By inflationarity, $\phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\phi \rightarrow_\Sigma^b \psi)$, whence by the Detachment Theorem, $\psi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi)$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b . Define $\text{Ax}^0 = \{\text{Ax}_\Sigma^0\}_{\Sigma \in |\mathbf{Sign}^b|}$, by setting, for all $\Sigma \in |\mathbf{Sign}^b|$, Ax_Σ^0 is the set consisting, for all σ^b in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi, \vec{\phi}, \vec{\psi} \in \text{SEN}^b(\Sigma)$,

- $\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \phi)$;
- $(\phi \rightarrow_\Sigma^b (\psi \rightarrow_\Sigma^b \chi)) \rightarrow_\Sigma^b ((\phi \rightarrow_\Sigma^b \psi) \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \chi))$;
- $(\phi_0 \rightarrow_\Sigma^b \psi_0) \rightarrow_\Sigma^b ((\psi_0 \rightarrow_\Sigma^b \phi_0) \rightarrow_\Sigma^b (\dots((\phi_{k-1} \rightarrow_\Sigma^b \psi_{k-1}) \rightarrow_\Sigma^b ((\psi_{k-1} \rightarrow_\Sigma^b \phi_{k-1}) \rightarrow_\Sigma^b (\sigma_\Sigma^b(\vec{\phi}) \rightarrow_\Sigma^b \sigma_\Sigma^b(\vec{\psi})))) \dots))$.

Furthermore, define $\text{Ir}^0 = \{\text{Ir}_\Sigma^0\}_{\Sigma \in |\mathbf{Sign}^b|}$ by setting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\text{Ir}_\Sigma^0 = \{\langle \{\phi, \phi \rightarrow_\Sigma^b \psi\}, \psi \rangle : \phi, \psi \in \text{SEN}^b(\Sigma)\}.$$

Finally, let $R^0 = \text{Ax}^0 \cup \text{Ir}^0$. Set $\mathcal{I}^0 = \langle \mathbf{F}, C^0 \rangle$ be the finitary π -institution, based on $\mathbf{F}$, with $C^0 = C^{R^0}$ the closure system on $\mathbf{F}$ generated by the collection R^0 of $\mathbf{F}$ -axioms and $\mathbf{F}$ -rules of inference.

Our work in Proposition 1794 allows us to formalize the fact that a congruential finitary π -institution having the Deduction Detachment Theorem with respect to $\rightarrow^b$ is an axiomatic extension of $\mathcal{I}^0$. Recall that $\mathcal{I} = \langle \mathbf{F}, C \rangle$ is an axiomatic extension of $\mathcal{I}^0$ if there exists an axiom family Ax' , such that $C = C^{R^0 \cup \text{Ax}'}$.

Theorem 1795 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with a binary natural transformation $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a congruential finitary π -institution having the Deduction Detachment Theorem with respect to $\rightarrow^b$. Then $\mathcal{I}$ is an axiomatic extension of $\mathcal{I}^0$.*

Proof: Since $\mathcal{I}$ is finitary, its closure system is specified by a collection $R = \text{Ax} \cup \text{Ir}$ of **F**-axioms and **F**-rules. We define $R' = \text{Ax}' \cup \text{Ir}'$, where, for all $\Sigma \in |\mathbf{Sign}^b|$,

- $\text{Ax}'_\Sigma = \text{Ax}_\Sigma \cup \{\phi_0 \rightarrow_\Sigma^b (\phi_i \rightarrow_\Sigma^b \dots \rightarrow_\Sigma^b (\phi_{n-1} \rightarrow_\Sigma^b \phi) \dots) : \langle \{\phi_0, \dots, \phi_{n-1}\}, \phi \rangle \in \text{Ir}_\Sigma\};$
- $\text{Ir}'_\Sigma = \{\langle \{\phi, \phi \rightarrow_\Sigma^b \psi\}, \psi \rangle : \phi, \psi \in \text{SEN}^b(\Sigma)\}.$

Note that, by the Deduction Theorem of $\mathcal{I}$, for every $\Sigma \in |\mathbf{Sign}^b|$, $\text{Ax}'_\Sigma \subseteq C_\Sigma(\emptyset)$. Moreover, by the Detachment Theorem for $\mathcal{I}$, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $\psi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi)$. Therefore, we conclude that $C^{R'} \leq C$.

Conversely, note that, by definition, $\text{Ax} \leq \text{Ax}'$. Moreover, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\langle \{\phi_0, \dots, \phi_{n-1}\}, \phi \rangle \in \text{Ir}_\Sigma$,

$$\phi \in C_\Sigma^{R'}(\Phi, \phi_0 \rightarrow_\Sigma^b (\phi_1 \rightarrow_\Sigma^b \dots \rightarrow_\Sigma^b (\phi_{n-1} \rightarrow_\Sigma^b \phi) \dots)) \subseteq C_\Sigma^{R'}(\Phi).$$

Hence, $C = C^R \leq C^{R'}$. We now conclude that $C = C^{R'}$. $\blacksquare$

Next, we show that, if $\mathcal{I}$ is an axiomatic extension of $\mathcal{I}^0$, then it has the Deduction Detachment Theorem with respect to $\rightarrow^b$.

Proposition 1796 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with a binary natural transformation $\rightarrow^b: (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ an axiomatic extension of $\mathcal{I}^0$. Then $\mathcal{I}$ has the Deduction Detachment Theorem with respect to $\rightarrow^b$.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi, \psi\} \subseteq \text{SEN}^b(\Sigma)$, such that $\phi \rightarrow_\Sigma^b \psi \in C_\Sigma(\Phi)$. Then, since, by hypothesis, $C^{R^0} \leq C$, we get

$$\psi \in C_\Sigma(\phi, \phi \rightarrow_\Sigma^b \psi) \subseteq C_\Sigma(\Phi, \phi).$$

Suppose, conversely, that $\psi \in C_\Sigma(\Phi, \phi)$. Then, there exists in $\mathcal{I}$ a proof $\phi_0, \phi_1, \dots, \phi_n = \psi$ of ψ from premises $\Phi \cup \{\phi\}$. We show by induction on $k \leq n$ that there exists a proof in $\mathcal{I}$ of $\phi \rightarrow_\Sigma^b \psi$ from premises Φ in $\mathcal{I}$.

- If $k = 0$, then $\phi_0 \in \text{Ax}_\Sigma$ or $\phi_0 \in \Phi \cup \{\phi\}$.
 - If $\phi_0 \in \text{Ax}_\Sigma$, then $\phi_0 \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \phi_0), \phi_0, \phi \rightarrow_\Sigma^b \phi_0$ is a proof in $\mathcal{I}$ of $\phi \rightarrow_\Sigma^b \phi_0$ from Φ ;
 - If $\phi_0 \in \Phi$, then $\phi_0 \rightarrow_\Sigma^b (\phi \rightarrow_\Sigma^b \phi_0), \phi_0, \phi \rightarrow_\Sigma^b \phi_0$ is a proof in $\mathcal{I}$ of $\phi \rightarrow_\Sigma^b \phi_0$ from premises Φ .
 - If $\phi_0 = \phi$, then

$$\begin{aligned} & (\phi_0 \rightarrow_\Sigma^b ((\phi_0 \rightarrow_\Sigma^b \phi_0) \rightarrow_\Sigma^b \phi_0)) \\ & \quad \rightarrow_\Sigma^b ((\phi_0 \rightarrow_\Sigma^b (\phi_0 \rightarrow_\Sigma^b \phi_0)) \rightarrow_\Sigma^b (\phi_0 \rightarrow_\Sigma^b \phi_0)) \\ & \phi_0 \rightarrow_\Sigma^b ((\phi_0 \rightarrow_\Sigma^b \phi_0) \rightarrow_\Sigma^b \phi_0) \\ & (\phi_0 \rightarrow_\Sigma^b (\phi_0 \rightarrow_\Sigma^b \phi_0)) \rightarrow_\Sigma^b (\phi_0 \rightarrow_\Sigma^b \phi_0) \\ & \phi_0 \rightarrow_\Sigma^b (\phi_0 \rightarrow_\Sigma^b \phi_0) \\ & \phi_0 \rightarrow_\Sigma^b \phi_0 \end{aligned}$$

is a proof in $\mathcal{I}$ of $\phi_0 \rightarrow_\Sigma^b \phi_0$ from Φ

- If $k > 0$, assume that, for all $\ell < k$, $\phi \rightarrow_{\Sigma}^b \phi_{\ell} \in C_{\Sigma}(\Phi)$. If ϕ_k is either an axiom or in $\Phi \cup \{\phi\}$, then the treatment is the same as in the Induction Basis. So assume, for the final case, that ϕ_k follows from preceding Σ -sentences in the sequel by an application of the only **F**-rule available, i.e., that, for some $i, j < k$, $\phi_i = \phi_j \rightarrow_{\Sigma}^b \phi_k$. Then, by the Induction Hypothesis, $\phi \rightarrow_{\Sigma}^b (\phi_j \rightarrow_{\Sigma}^b \phi_k) \in C_{\Sigma}(\Phi)$ and $\phi \rightarrow_{\Sigma}^b \phi_j \in C_{\Sigma}(\Phi)$. Then by adjoining the following Σ -sentences to the sequence consisting of the proofs in $\mathcal{I}$ from Φ of $\phi \rightarrow_{\Sigma}^b (\phi_j \rightarrow_{\Sigma}^b \phi_k)$ and $\phi \rightarrow_{\Sigma}^b \phi_j$, we obtain a proof in $\mathcal{I}$ from Φ of $\phi \rightarrow_{\Sigma}^b \phi_k$:

$$\begin{array}{l}
\vdots \\
\phi \rightarrow_{\Sigma}^b (\phi_j \rightarrow_{\Sigma}^b \phi_k) \\
\vdots \\
\phi \rightarrow_{\Sigma}^b \phi_j \\
(\phi \rightarrow_{\Sigma}^b (\phi_j \rightarrow_{\Sigma}^b \phi_k)) \rightarrow_{\Sigma}^b ((\phi \rightarrow_{\Sigma}^b \phi_j) \rightarrow_{\Sigma}^b (\phi \rightarrow_{\Sigma}^b \phi_k)) \\
(\phi \rightarrow_{\Sigma}^b \phi_j) \rightarrow_{\Sigma}^b (\phi \rightarrow_{\Sigma}^b \phi_k) \\
\phi \rightarrow_{\Sigma}^b \phi_k
\end{array}$$

This completes the Induction Step.

Thus, we conclude that $\phi \rightarrow_{\Sigma}^b \psi \in C_{\Sigma}(\Phi)$ and, therefore, $\mathcal{I}$ has the Deduction Detachment Theorem with respect to $\rightarrow^b$. ■

Moreover, under the same hypotheses, $\mathcal{I}$ turns out to be strongly Fregean.

Proposition 1797 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with a binary natural transformation $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ an axiomatic extension of $\mathcal{I}^0$. Then $\mathcal{I}$ is congruential.*

Proof: Let $T \in \text{ThFam}(\mathcal{I})$, $\sigma^b: (\mathbf{SEN}^b)^k \rightarrow \mathbf{SEN}^b$ be in N^b , $\Sigma \in |\mathbf{Sign}^b|$ and $\vec{\phi}, \vec{\psi} \in \mathbf{SEN}^b(\Sigma)$, such that $C_{\Sigma}(T_{\Sigma}, \phi_i) = C_{\Sigma}(T_{\Sigma}, \psi_i)$, for all $i < k$. Then, by Proposition 1796, we get that

$$\phi_i \rightarrow_{\Sigma}^b \psi_i, \psi_i \rightarrow_{\Sigma}^b \phi_i \in C_{\Sigma}(T_{\Sigma}) = T_{\Sigma}, \quad i < k.$$

Since $C^{R^0} \leq C$, we get, by multiple applications of the Detachment Theorem, $\sigma_{\Sigma}^b(\vec{\phi}) \rightarrow_{\Sigma}^b \sigma_{\Sigma}^b(\vec{\psi}), \sigma_{\Sigma}^b(\vec{\psi}) \rightarrow_{\Sigma}^b \sigma_{\Sigma}^b(\vec{\phi}) \in C_{\Sigma}(T_{\Sigma})$. Hence, $C_{\Sigma}(T_{\Sigma}, \sigma_{\Sigma}^b(\vec{\phi})) = C_{\Sigma}(T_{\Sigma}, \sigma_{\Sigma}^b(\vec{\psi}))$. Thus, $\tilde{\lambda}(T)$ is a congruence family on $\mathbf{F}$ and, therefore, $\mathcal{I}$ is congruential. ■

Thus, we have obtained an exact characterization of those π -institutions that are congruential and possess the Deduction Detachment Property with respect to a binary natural transformation $\rightarrow^b$.

Theorem 1798 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with a binary natural transformation $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary π -institution based on $\mathbf{F}$. $\mathcal{I}$ is congruential and has the Deduction Detachment Theorem with respect to $\rightarrow^b$ if and only if it is an axiomatic extension of $\mathcal{I}^0$.*

Proof: The implication left-to-right is by Theorem 1795. The converse is given by Propositions 1796 and 1797. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. Recall that a Σ -**sequent** is an expression of the form $\Phi \vdash_\Sigma \phi$, where $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$. It is **finite** if Φ is a finite set. Moreover, a **Gentzen F-rule** is an expression of the form

$$\langle \{\Phi_i \vdash_\Sigma \phi_i : i \in I\}, \Phi \vdash_\Sigma \phi \rangle,$$

where $\Phi_i \vdash_\Sigma \phi_i$, $i \in I$, and $\Phi \vdash_\Sigma \phi$ are Σ -sequents. We say the rule is **finitary** if I is finite and all sequents in the rule are finite.

Let $\mathbb{L} = \langle \mathcal{A}, D \rangle$ be an $\mathbf{F}$ -structure, $\Sigma \in |\mathbf{Sign}^b|$, $s = \Phi \vdash_\Sigma \phi$ a Σ -sequent and $r = \langle \{\Phi_i \vdash_\Sigma \phi_i : i \in I\}, \Phi \vdash_\Sigma \phi \rangle$ a Gentzen $\mathbf{F}$ -rule.

- $\mathbb{L}$ **satisfies** s or s is **true** or **valid** or **holds in** $\mathbb{L}$, written $\mathbb{L} \models_\Sigma s$, if $\alpha_\Sigma(\phi) \in D_{F(\Sigma)}(\alpha_\Sigma(\Phi))$;
- $\mathbb{L}$ **satisfies** r or r is **true** or **valid** or **holds in** $\mathbb{L}$, written $\mathbb{L} \models_\Sigma r$, if

$$\alpha_\Sigma(\phi_i) \in D_{F(\Sigma)}(\alpha_\Sigma(\Phi_i)), \quad i \in I, \quad \text{imply} \quad \alpha_\Sigma(\phi) \in D_{F(\Sigma)}(\alpha_\Sigma(\Phi)).$$

These definitions are extended in the ordinary way to sets of rules and sets of structures.

Let $\mathbf{M}$ be a class of $\mathbf{F}$ -structures. We say that $\mathbf{M}$ is a **(finitary) Gentzen class** if it is specified by a collection $R = \{R_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$ of (finitary) Gentzen $\mathbf{F}$ -rules (including sequents, viewed as rules with empty sets of premises).

The following examples illustrate the definition.

- The class of all finitary $\mathbf{F}$ -structures having the Deduction Detachment Theorem with respect to a binary natural transformation $\rightarrow^b$: $(\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ in N^b is a finitary Gentzen class specified by $R = \{R_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$, where

$$R_\Sigma = \{ \langle \phi, \phi \rightarrow_\Sigma^b \psi \vdash_\Sigma \psi : \phi, \psi \in \mathbf{SEN}^b(\Sigma) \rangle, \\ \cup \{ \langle \{ \Phi, \phi \vdash_\Sigma \psi \}, \Phi \vdash_\Sigma \phi \rightarrow_\Sigma^b \psi \rangle : \Phi \cup \{ \phi, \psi \} \subseteq_f \mathbf{SEN}^b(\Sigma) \} \}.$$

- The class of all finitary self extensional $\mathbf{F}$ -structures is also a finitary Gentzen class specified by $R = \{R_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$, with

$$R_\Sigma = \{ \langle \{ \langle \phi_i \vdash_\Sigma \psi_i, \psi_i \vdash_\Sigma \phi_i : i < k \rangle, \sigma_\Sigma^b(\vec{\phi}) \vdash_\Sigma \sigma_\Sigma^b(\vec{\psi}) \rangle : \\ \sigma^b \in N^b, \vec{\phi}, \vec{\psi} \in \mathbf{SEN}^b(\Sigma) \} \}.$$

- The class of all finitary congruential $\mathbf{F}$ -structures is also a finitary Gentzen class specified by $R = \{R_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$, with

$$R_\Sigma = \{ \langle \{ \langle \Phi, \phi_i \vdash_\Sigma \psi_i, \Phi, \psi_i \vdash_\Sigma \phi_i : i < k \rangle, \Phi, \sigma_\Sigma^b(\vec{\phi}) \vdash_\Sigma \sigma_\Sigma^b(\vec{\psi}) \rangle : \\ \sigma^b \in N^b, \Phi \subseteq_f \mathbf{SEN}^b(\Sigma), \vec{\phi}, \vec{\psi} \in \mathbf{SEN}^b(\Sigma) \} \}.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\Sigma \in |\mathbf{Sign}^b|$ and $r = \langle \{ \Phi_i \vdash_{\Sigma} \phi_i : i \in I \}, \Phi \vdash_{\Sigma} \phi \rangle$ a finitary Gentzen $\mathbf{F}$ -rule. The **accumulation** of r , denoted $\text{acm}(r)$, is the collection of finitary Gentzen $\mathbf{F}$ -rules

$$\text{acm}(r) = \{ \langle \{ X, \Phi_i \vdash_{\Sigma} \phi_i : i \in I \}, X, \Phi \vdash_{\Sigma} \phi \rangle : X \subseteq_f \text{SEN}^b(\Sigma) \}.$$

We say that a collection R of Gentzen rules is **accumulative** if it is the union of accumulations. We say that a class $\mathbf{M}$ of $\mathbf{F}$ -structures is an **accumulative class** if it is a Gentzen class specified by an accumulative collection of Gentzen $\mathbf{F}$ -rules.

Note, e.g., that both the class of all finitary $\mathbf{F}$ -structures having the Deduction Detachment Theorem with respect to $\rightarrow^b$ and the class of congruential finitary $\mathbf{F}$ -structures are accumulative classes. On the other hand, the class of all self extensional finitary $\mathbf{F}$ -structures is not accumulative.

It is not difficult to see that satisfaction of Gentzen $\mathbf{F}$ -rules is preserved under bilogical morphisms between $\mathbf{F}$ -structures.

Proposition 1799 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathbb{L} = \langle \mathcal{A}, D \rangle$, $\mathbb{L}' = \langle \mathcal{A}', D' \rangle$ two $\mathbf{F}$ -structures, $\langle H, \gamma \rangle : \mathbb{L} \vdash \mathbb{L}'$ a biological morphism, $\Sigma \in |\mathbf{Sign}^b|$ and $r = \langle \{ \Phi_i \vdash_{\Sigma} \phi_i : i \in I \}, \Phi \vdash_{\Sigma} \phi \rangle$ a Gentzen $\mathbf{F}$ -rule. Then*

$$\mathbb{L} \models_{\Sigma} r \quad \text{iff} \quad \mathbb{L}' \models_{\Sigma} r.$$

Proof: We have, by the definition of satisfaction and that of biological morphism, $\mathbb{L} \models_{\Sigma} r$ if and only if

$$\alpha_{\Sigma}(\phi_i) \in D_{F(\Sigma)}(\alpha_{\Sigma}(\Phi_i)), \quad i \in I, \quad \text{imply} \quad \alpha_{\Sigma}(\phi) \in D_{F(\Sigma)}(\alpha_{\Sigma}(\Phi)),$$

if and only if

$$\begin{aligned} \gamma_{F(\Sigma)}(\alpha_{\Sigma}(\phi_i)) &\in D'_{H(F(\Sigma))}(\gamma_{F(\Sigma)}(\alpha_{\Sigma}(\Phi_i))), \quad i \in I, \\ \text{imply} \quad \gamma_{F(\Sigma)}(\alpha_{\Sigma}(\phi)) &\in D'_{H(F(\Sigma))}(\gamma_{F(\Sigma)}(\alpha_{\Sigma}(\Phi))), \end{aligned}$$

if and only if

$$\alpha'_{\Sigma}(\phi_i) \in D'_{F'(\Sigma)}(\alpha'_{\Sigma}(\Phi_i)), \quad i \in I, \quad \text{imply} \quad \alpha'_{\Sigma}(\phi) \in D'_{F'(\Sigma)}(\alpha'_{\Sigma}(\Phi)),$$

if and only if $\mathbb{L}' \models_{\Sigma} r$. ■

Additionally, we can show that the accumulation of a Gentzen rule holding in a finitary $\mathbf{F}$ -structure $\mathbb{L} = \langle \mathcal{A}, D \rangle$ necessarily holds in all structures of the form $\mathbb{L}^T = \langle \mathcal{A}, D^T \rangle$, where, for all $T \in \text{ThFam}(\mathbb{L})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{ \phi \} \subseteq \text{SEN}^b(\Sigma)$,

$$\phi \in D_{\Sigma}^T(\Phi) \quad \text{iff} \quad \phi \in D_{\Sigma}(T_{\Sigma}, \Phi).$$

Lemma 1800 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\Sigma \in |\mathbf{Sign}^b|$, $r = \langle \{ \Phi_i \vdash_{\Sigma} \phi_i : i \in I \}, \Phi \vdash_{\Sigma} \phi \rangle$ be an $\mathbf{F}$ -rule and $\mathbb{L} = \langle \mathcal{A}, D \rangle$ a finitary $\mathbf{F}$ -structure. If $\mathbb{L} \models_{\Sigma} \text{acm}(r)$, then, for all $T \in \text{ThFam}(\mathbb{L})$, $\mathbb{L}^T \models_{\Sigma} \text{acm}(r)$.*

Proof: Let $X \subseteq_f \text{SEN}^b(\Sigma)$ and assume $\alpha_\Sigma(\phi_i) \in D_{F(\Sigma)}^T(\alpha_\Sigma(X), \alpha_\Sigma(\Phi_i))$, for all $i \in I$. By definition,

$$\alpha_\Sigma(\phi_i) \in D_{F(\Sigma)}(T_\Sigma, \alpha_\Sigma(X), \alpha_\Sigma(\Phi_i)), \quad i \in I.$$

But $\langle F, \alpha \rangle$ is surjective, whence there exists $\Psi \in \text{SEN}^b(\Sigma)$, such that $\alpha_\Sigma(\Psi) = T_\Sigma$. Therefore, we get

$$\alpha_\Sigma(\phi_i) \in D_{F(\Sigma)}(\alpha_\Sigma(\Psi), \alpha_\Sigma(X), \alpha_\Sigma(\Phi_i)), \quad i \in I.$$

By finitariness of $\mathbb{L}$, we get that there exists $\Psi' \subseteq_f \Psi$, such that

$$\alpha_\Sigma(\phi_i) \in D_{F(\Sigma)}(\alpha_\Sigma(\Psi'), \alpha_\Sigma(X), \alpha_\Sigma(\Phi_i)), \quad i \in I.$$

By the hypothesis, $\alpha_\Sigma(\phi) \in D_{F(\Sigma)}(\alpha_\Sigma(\Psi'), \alpha_\Sigma(X), \alpha_\Sigma(\Phi))$. Since $\Psi' \subseteq \Psi$, we get $\alpha_\Sigma(\phi) \in D_{F(\Sigma)}(\alpha_\Sigma(\Psi), \alpha_\Sigma(X), \alpha_\Sigma(\Phi))$. Thus,

$$\alpha_\Sigma(\phi) \in D_{F(\Sigma)}(T_\Sigma, \alpha_\Sigma(X), \alpha_\Sigma(\Phi)),$$

i.e., $\alpha_\Sigma(\phi) \in D_{F(\Sigma)}^T(\alpha_\Sigma(X), \alpha_\Sigma(\Phi))$. We conclude that $\mathbb{L}^T \models_\Sigma \text{acm}(r)$. ■

Proposition 1801 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ an accumulative class of finitary $\mathbf{F}$ -structures. If $\mathbb{L} = \langle \mathcal{A}, D \rangle \in \mathbf{M}$, then, for all $T \in \text{ThFam}(\mathbb{L})$, $\mathbb{L}^T = \langle \mathcal{A}, D^T \rangle \in \mathbf{M}$.*

Proof: Directly by Lemma 1800. ■

Next, we show that, if $\mathcal{I}$ is an accumulative protoalgebraic finitary π -institution, then all full $\mathcal{I}$ -structures satisfy the defining Gentzen $\mathbf{F}$ -rules of $\mathcal{I}$.

Theorem 1802 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ an accumulative class of finitary $\mathbf{F}$ -structures. If $\mathcal{I} = \langle \mathbf{F}, C \rangle$ is a protoalgebraic π -institution in $\mathbf{M}$, then the full $\mathcal{I}$ -structures of the form $\mathbb{L} = \langle \mathcal{A}, D \rangle$, where $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with F an isomorphism, are in $\mathbf{M}$.*

Proof: Suppose $\mathcal{I} = \langle \mathbf{F}, C \rangle$ is a protoalgebraic π -institution in $\mathbf{M}$. By Proposition 1799, it suffices to show that, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with F an isomorphism, $\mathbb{L} = \langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle \in \mathbf{M}$. By protoalgebraicity and Theorem 1614, we get

$$\alpha^{-1}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) = \text{ThFam}(\mathcal{I})^T,$$

where $T = \alpha^{-1}(C^{\mathcal{I}, \mathcal{A}}(\emptyset))$. But

$$\langle F, \alpha \rangle : \langle \mathcal{F}, \alpha^{-1}(\text{FiFam}^{\mathcal{I}}(\mathcal{A})) \rangle \rightarrow \langle \mathcal{A}, \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \rangle$$

is a bilogical morphism. Since, by the hypothesis and Proposition 1801, we have $\langle \mathcal{F}, \text{ThFam}(\mathcal{I})^T \rangle \in \mathbf{M}$, we get, by Proposition 1799. $\mathbb{L} \in \mathbf{M}$. ■

Now we get easily the following results concerning the Deduction Detachment Theorem and congruentiality, respectively.

Corollary 1803 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\rightarrow^b: (\mathbf{SEN}^b)^2 \rightarrow \mathbf{SEN}^b$ a binary natural transformations in N^b , and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a finitary π -institution based on $\mathbf{F}$ that has the Deduction Detachment Theorem with respect to $\rightarrow^b$. Then, every full $\mathcal{I}$ -structure of the form $\mathbb{L} = \langle \mathcal{A}, D \rangle$, where $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with F an isomorphism, has the Deduction Detachment Theorem with respect to $\rightarrow^b$.*

Proof: This follows from Theorem 1802 once it is show that if $\mathcal{I}$ has the Deduction Detachment Property with respect to $\rightarrow^b$, then it is protoalgebraic. Suppose $T, T' \in \text{ThFam}(\mathcal{I})$, such that $T \leq T'$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \Omega_\Sigma(T)$. Then, for all σ^b in N^b , all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\vec{\chi} \in \mathbf{SEN}^b(\Sigma')$, we have

$$\sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\phi), \vec{\chi}) \in T_{\Sigma'} \quad \text{iff} \quad \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\psi), \vec{\chi}) \in T_{\Sigma'}.$$

But, by the Deduction Detachment Theorem, this holds if and only if,

$$\begin{aligned} \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\phi), \vec{\chi}) &\rightarrow_{\Sigma'}^b \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\psi), \vec{\chi}), \\ \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\psi), \vec{\chi}) &\rightarrow_{\Sigma'}^b \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\phi), \vec{\chi}) \in T_{\Sigma'}. \end{aligned}$$

Since $T \leq T'$, we get that

$$\begin{aligned} \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\phi), \vec{\chi}) &\rightarrow_{\Sigma'}^b \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\psi), \vec{\chi}), \\ \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\psi), \vec{\chi}) &\rightarrow_{\Sigma'}^b \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\phi), \vec{\chi}) \in T'_{\Sigma'}. \end{aligned}$$

Hence, again by the Deduction Detachment Theorem,

$$\sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\phi), \vec{\chi}) \in T'_{\Sigma'} \quad \text{iff} \quad \sigma_{\Sigma'}^b(\mathbf{SEN}^b(f)(\psi), \vec{\chi}) \in T'_{\Sigma'}.$$

This gives $\langle \phi, \psi \rangle \in \Omega_\Sigma(T')$. Therefore, $\Omega(T) \leq \Omega(T')$ and, hence, $\mathcal{I}$ is protoalgebraic. $\blacksquare$

Corollary 1804 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a protoalgebraic finitary π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is congruential, then the full $\mathcal{I}$ -structures of the form $\mathbb{L} = \langle \mathcal{A}, D \rangle$, where $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with F an isomorphism, are also congruential.*

Proof: This follows from Theorem 1802 and the fact that the class of all congruential finitary $\mathbf{F}$ -structures is accumulative. $\blacksquare$

Now we look at the converse, in a certain sense, of the inheritance problem of properties specified by Gentzen $\mathbf{F}$ -rules. Namely, we identify a type of properties that are bequeathed to the π -institution specified by classes of $\mathbf{F}$ -structures, when all structures in the class satisfy the property.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ be a class of $\mathbf{F}$ -structures. Recall that the π -institution $\mathcal{I}^{\mathbf{M}} = \langle \mathbf{F}, C^{\mathbf{M}} \rangle$ determined by, or

specified by or generated by, $\mathbf{M}$ is defined by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$,

$$\phi \in C_{\Sigma}^{\mathbf{M}}(\Phi) \quad \text{iff} \quad \text{for all } \langle \mathcal{A}, D \rangle \in \mathbf{M}, \Sigma' \in |\mathbf{Sign}^b|, f \in \mathbf{Sign}^b(\Sigma, \Sigma'), \\ \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \in D_{F(\Sigma')}(\alpha_{\Sigma'}(\text{SEN}^b(f)(\Phi))).$$

Let, now, $\Sigma \in |\mathbf{Sign}^b|$ and $r = \langle \{\Phi_i \vdash_{\Sigma} \phi_i : i \in I\}, \Phi \vdash_{\Sigma} \phi \rangle$ be a Gentzen $\mathbf{F}$ -rule. The **structure of** r , denoted $\text{str}(r)$ is the family of all Gentzen $\mathbf{F}$ -rules of the form

$$\text{SEN}^b(f)(r) := \langle \{\text{SEN}^b(f)(\Phi_i) \vdash_{\Sigma'} \text{SEN}^b(f)(\phi_i) : i \in I\}, \\ \text{SEN}^b(f)(\Phi) \vdash_{\Sigma'} \text{SEN}^b(f)(\phi) \rangle,$$

where $\Sigma' \in |\mathbf{Sign}^b|$ and $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$. We say that a collection R of Gentzen $\mathbf{F}$ -rules is **structural** if it is the union of structures. We say that a class $\mathbf{M}$ of $\mathbf{F}$ -structures is a **structural class** if it is a Gentzen class specified by a structural collection of Gentzen $\mathbf{F}$ -rules.

Lemma 1805 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\Sigma \in |\mathbf{Sign}^b|$, $r = \langle \{\Phi_i \vdash_{\Sigma} \phi_i : i \in I\}, \Phi \vdash_{\Sigma} \phi \rangle$ a Gentzen $\mathbf{F}$ -rule and $\mathbf{M}$ a class $\mathbf{F}$ -structures. If $\mathbf{M} \models \text{str}(r)$, then $\text{str}(r)$ holds in $\mathcal{I}^{\mathbf{M}}$.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$, $r = \langle \{\Phi_i \vdash_{\Sigma} \phi_i : i \in I\}, \Phi \vdash_{\Sigma} \phi \rangle$ and suppose $\mathbf{M} \models \text{str}(r)$ and $\Sigma' \in |\mathbf{Sign}^b|$, $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, such that

$$\text{SEN}^b(f)(\phi_i) \in C_{\Sigma'}^{\mathbf{M}}(\text{SEN}^b(f)(\Phi_i)), \quad i \in I.$$

Then, by definition of $\mathcal{I}^{\mathbf{M}}$, for all $\langle \mathcal{A}, D \rangle \in \mathbf{M}$, all $\Sigma'' \in |\mathbf{Sign}^b|$ and all $g \in \mathbf{Sign}^b(\Sigma', \Sigma'')$,

$$\Sigma \xrightarrow{f} \Sigma' \xrightarrow{g} \Sigma''$$

$$\alpha_{\Sigma''}(\text{SEN}^b(g)(\text{SEN}^b(f)(\phi_i))) \in D_{F(\Sigma'')}(\alpha_{\Sigma''}(\text{SEN}^b(g)(\text{SEN}^b(f)(\Phi_i)))), \quad i \in I,$$

i.e.,

$$\alpha_{\Sigma''}(\text{SEN}^b(gf)(\phi_i)) \in D_{F(\Sigma'')}(\alpha_{\Sigma''}(\text{SEN}^b(gf)(\Phi_i))), \quad i \in I.$$

Since, by hypothesis, $\mathbf{M} \models \text{str}(r)$ and $\langle \mathcal{A}, D \rangle \in \mathbf{M}$, we get

$$\alpha_{\Sigma''}(\text{SEN}^b(gf)(\phi)) \in D_{F(\Sigma'')}(\alpha_{\Sigma''}(\text{SEN}^b(gf)(\Phi)))$$

and, thus,

$$\alpha_{\Sigma''}(\text{SEN}^b(g)(\text{SEN}^b(f)(\phi))) \in D_{F(\Sigma'')}(\alpha_{\Sigma''}(\text{SEN}^b(g)(\text{SEN}^b(f)(\Phi)))).$$

By the definition of $\mathcal{I}^{\mathbf{M}}$, we conclude that $\text{SEN}^b(f)(\phi) \in C_{\Sigma'}^{\mathbf{M}}(\text{SEN}^b(f)(\Phi))$. Therefore, $\mathcal{I}^{\mathbf{M}} \models \text{str}(r)$. $\blacksquare$

Theorem 1806 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{P}$ a structural class $\mathbf{F}$ -structures. If $\mathbf{M} \subseteq \mathbf{P}$, then $\mathcal{I}^{\mathbf{M}} \in \mathbf{P}$.*

Proof: Suppose that $\text{str}(r)$ is a rule of $\mathbf{P}$. Since $\mathbf{M} \subseteq \mathbf{P}$, $\text{str}(r)$ is a rule of $\mathbf{M}$. Therefore, by Lemma 1805, $\text{str}(r)$ is a rule of $\mathcal{I}^{\mathbf{M}}$. Thus, $\mathcal{I}^{\mathbf{M}}$ satisfies all Gentzen $\mathbf{F}$ -rules determining $\mathbf{P}$ (since all of them are, by hypothesis, structural) and, therefore, $\mathcal{I}^{\mathbf{M}} \in \mathbf{P}$. ■

An application of Theorem 1806 gives that, if all $\mathbf{F}$ -structures in a class $\mathbf{M}$ are congruential, then the π -institution determined by the class is also congruential.

Corollary 1807 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a class of congruential $\mathbf{F}$ -structures. Then $\mathcal{I}^{\mathbf{M}}$ is congruential.*

Proof: It suffices, by Theorem 1806 to show that the class of congruential $\mathbf{F}$ -structures is a structural class. This is easily seen by observing that it is the class of $\mathbf{F}$ -structures specified by $R = \{R_{\Sigma}\}_{\Sigma \in |\mathbf{Sign}^b|}$, with

$$R_{\Sigma} = \{ \langle \{ \Phi, \phi_i \vdash_{\Sigma} \psi_i, \Phi, \psi_i \vdash_{\Sigma} \phi_i : i < k \}, \Phi, \sigma_{\Sigma}^b(\vec{\phi}) \vdash_{\Sigma} \sigma_{\Sigma}^b(\vec{\psi}) \rangle : \sigma^b \in N^b, \Phi \subseteq \mathbf{SEN}^b(\Sigma), \vec{\phi}, \vec{\psi} \in \mathbf{SEN}^b(\Sigma) \}.$$

It is easy to check that R is a structural class of Gentzen $\mathbf{F}$ -rules, whence the class of all congruential $\mathbf{F}$ -structures is a structural class. ■

23.5 Fregeanity and Congruence Orderability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\mathbf{SEN}^b)^k \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathbf{K}$ a τ^b -pointed quasivariety of $\mathbf{F}$ -algebraic systems.

We say that $\mathbf{K}$ is **congruence orderable** if, for all $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle \in \mathbf{K}$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,

$$\phi = \psi \quad \text{if} \quad \text{for all } \Sigma' \in |\mathbf{Sign}^b|, f \in \mathbf{Sign}^b(\Sigma, \Sigma'), \\ \Theta^{\mathbf{K}, \mathcal{A}}(\mathbf{SEN}^b(f)(\phi), \tau_{\Sigma'}^{\mathcal{A}}) = \Theta^{\mathbf{K}, \mathcal{A}}(\mathbf{SEN}^b(f)(\psi), \tau_{\Sigma'}^{\mathcal{A}}).$$

Moreover, we say that $\mathbf{K}$ is **Fregean** if it is both relatively point regular and congruence orderable.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\mathbf{SEN}^b)^k \rightarrow \mathbf{SEN}^b$ in N^b , and $\mathbf{K}$ a τ^b -pointed quasivariety of $\mathbf{F}$ -algebraic systems. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, define the relation family

$$\leq^{\mathbf{K}, \mathcal{A}} = \{ \leq_{\Sigma}^{\mathbf{K}, \mathcal{A}} \}_{\Sigma \in |\mathbf{Sign}^b|}$$

on $\mathcal{A}$ by letting, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\phi \leq_{\Sigma}^{\mathbf{K}, \mathcal{A}} \psi \quad \text{iff} \quad \text{for all } \Sigma' \in |\mathbf{Sign}|, f \in \mathbf{Sign}(\Sigma, \Sigma'), \\ \Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(f)(\phi), \tau_{\Sigma'}^{\mathcal{A}}) \geq \Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(f)(\psi), \tau_{\Sigma'}^{\mathcal{A}}).$$

We show that $\leq^{\mathbf{K}, \mathcal{A}}$ is in fact a quasiordering system (**qosystem**, for short) on $\mathcal{A}$.

Proposition 1808 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^k \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a τ^b -pointed quasivariety of $\mathbf{F}$ -algebraic systems. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\leq^{\mathbf{K}, \mathcal{A}}$ is a quasiordering system on $\mathcal{A}$.*

Proof: Let $\Sigma \in |\mathbf{Sign}|$. Since, for all $\phi \in \text{SEN}(\Sigma)$, all $\Sigma' \in |\mathbf{Sign}|$ and all $f \in \mathbf{Sign}(\Sigma, \Sigma')$, $\Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(f)(\phi), \tau_{\Sigma'}^{\mathcal{A}}) = \Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(f)(\phi), \tau_{\Sigma'}^{\mathcal{A}})$, we get that $\phi \leq_{\Sigma}^{\mathbf{K}, \mathcal{A}} \phi$ and $\leq^{\mathbf{K}, \mathcal{A}}$ is reflexive. Since, for all $\phi, \psi, \chi \in \text{SEN}(\Sigma)$, if $\phi \leq_{\Sigma}^{\mathbf{K}, \mathcal{A}} \psi$ and $\psi \leq_{\Sigma}^{\mathbf{K}, \mathcal{A}} \chi$ imply, by definition, that, for all $\Sigma' \in |\mathbf{Sign}|$ and all $f \in \mathbf{Sign}(\Sigma, \Sigma')$,

$$\Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(f)(\phi), \tau_{\Sigma'}^{\mathcal{A}}) \geq \Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(f)(\psi), \tau_{\Sigma'}^{\mathcal{A}}) \geq \Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(f)(\chi), \tau_{\Sigma'}^{\mathcal{A}}),$$

we, get, again by definition, $\phi \leq_{\Sigma}^{\mathbf{K}, \mathcal{A}} \chi$. Thus, $\leq^{\mathbf{K}, \mathcal{A}}$ is also transitive.

Finally, suppose $\phi \leq_{\Sigma}^{\mathbf{K}, \mathcal{A}} \psi$ and let $\Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$. Then, by definition, for all $\Sigma'' \in |\mathbf{Sign}|$ and all $h \in \mathbf{Sign}(\Sigma', \Sigma'')$, we get

$$\Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(h)(\phi), \tau_{\Sigma''}^{\mathcal{A}}) \geq \Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(h)(\psi), \tau_{\Sigma''}^{\mathcal{A}}).$$

In particular, for all $\Sigma'' \in |\mathbf{Sign}|$ and all $g \in \mathbf{Sign}(\Sigma', \Sigma'')$,

$$\begin{array}{ccc} \Sigma & \xrightarrow{f} & \Sigma' \\ & \searrow gf & \swarrow g \\ & \Sigma'' & \end{array}$$

$$\Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(g)(\text{SEN}(f)(\phi)), \tau_{\Sigma''}^{\mathcal{A}}) \geq \Theta^{\mathbf{K}, \mathcal{A}}(\text{SEN}(g)(\text{SEN}(f)(\psi)), \tau_{\Sigma''}^{\mathcal{A}}),$$

i.e., $\text{SEN}(f)(\phi) \leq_{\Sigma'}^{\mathbf{K}, \mathcal{A}} \text{SEN}(f)(\psi)$ and $\leq^{\mathbf{K}, \mathcal{A}}$ is a system. ■

Corollary 1809 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^k \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a τ^b -pointed quasivariety of $\mathbf{F}$ -algebraic systems. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, the qosystem $\leq^{\mathbf{K}, \mathcal{A}}$ is a posystem if and only if $\mathbf{K}$ is congruence orderable.*

Proof: Clear, by Proposition 1809 and the definitions of $\leq^{\mathbf{K}, \mathcal{A}}$ and of congruence orderability. ■

Recall the assertional π -institution $\mathcal{I}^{\mathbf{K}, \tau}$ associated with a τ^b -pointed quasivariety $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems. Recall, also, that, if $\mathcal{I}^{\mathbf{K}, \tau}$ is family regular,

protoalgebraic, with τ^b a natural theorem, then the quasivariety $\mathbf{K}$ is relatively point regular.

We show, next, that, if $\mathcal{I}^{K,\tau}$ is strongly Fregean, protoalgebraic, with τ^b a natural theorem, then it is also family regular. Thus, the property of being strongly Fregean, protoalgebraic, with τ^b a natural theorem is stronger than being family regular, protoalgebraic, with τ^b a natural theorem. In terms of the τ^b -pointed quasivariety $\mathbf{K}$, this is reflected, as we shall see in the following theorem, in the fact that, in addition to being relatively point regular, it is also congruence orderable, i.e., it is a Fregean quasivariety of $\mathbf{F}$ -algebraic systems.

Lemma 1810 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^k \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a τ^b -pointed quasivariety of $\mathbf{F}$ -algebraic systems. If $\mathcal{I}^{K,\tau} = \langle \mathbf{F}, C^{K,\tau} \rangle$ is Fregean, then it is also family regular.*

Proof: Suppose $\mathcal{I}^{K,\tau}$ is Fregean. Let $\Sigma \in |\mathbf{Sign}^b|$, $\phi, \psi \in \text{SEN}^b(\Sigma)$ and consider the theory family $C^{K,\tau}(\phi, \psi)$. We have, for all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$C_{\Sigma'}^{K,\tau}(C_{\Sigma'}^{K,\tau}(\phi, \psi), \text{SEN}^b(f)(\phi)) = C_{\Sigma'}^{K,\tau}(\phi, \psi) = C_{\Sigma'}^{K,\tau}(C_{\Sigma'}^{K,\tau}(\phi, \psi), \text{SEN}^b(f)(\psi)).$$

Therefore, we get

$$\begin{aligned} \langle \phi, \psi \rangle &\in \widetilde{\Lambda}_{\Sigma}(C^{K,\tau}(\phi, \psi)) \\ &= \widetilde{\Omega}_{\Sigma}(C^{K,\tau}(\phi, \psi)) \quad (\text{by Fregeanity}) \\ &\subseteq \Omega_{\Sigma}(C^{K,\tau}(\phi, \psi)). \end{aligned}$$

This shows that $\mathcal{I}^{K,\tau}$ is family regular. ■

Theorem 1811 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\tau^b : (\text{SEN}^b)^k \rightarrow \text{SEN}^b$ in N^b , and $\mathbf{K}$ a τ^b -pointed quasivariety of $\mathbf{F}$ -algebraic systems. If $\mathcal{I}^{K,\tau} = \langle \mathbf{F}, C^{K,\tau} \rangle$ is Fregean, protoalgebraic, with τ^b a natural theorem, then $\mathbf{K}$ is Fregean.*

Proof: Since $\mathcal{I}^{K,\tau}$ is Fregean, by Lemma 1811, it is family regular. Since $\mathcal{I}^{K,\tau}$ is family regular, protoalgebraic, with τ^b a natural theorem, by Theorem 1393, $\mathbf{K}$ is a relatively point regular quasivariety of $\mathbf{F}$ -algebraic systems. Thus, to show that $\mathbf{K}$ is Fregean, it suffices, by definition, to show that it is also congruence orderable.

To this end, assume that $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle \in \mathbf{K}$, $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi \in \text{SEN}(\Sigma)$, such that, for all $\Sigma' \in |\mathbf{Sign}|$ and all $f \in \mathbf{Sign}(\Sigma, \Sigma')$,

$$\Theta^{K,\mathcal{A}}(\text{SEN}(f)(\phi), \tau_{\Sigma'}^{\mathcal{A}}) = \Theta^{K,\mathcal{A}}(\text{SEN}(f)(\psi), \tau_{\Sigma'}^{\mathcal{A}}).$$

This is equivalent to asserting that

$$C_{\Sigma}^{\mathcal{I}^{K,\tau},\mathcal{A}}(\phi) = C_{\Sigma}^{\mathcal{I}^{K,\tau},\mathcal{A}}(\psi).$$

Thus, we obtain

$$\begin{aligned}
 \langle \phi, \psi \rangle &\in \tilde{\Lambda}_{\Sigma}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}^{\mathbf{K}, \top}}(\mathcal{A})) \quad (\text{definition of Frege relation}) \\
 &= \tilde{\Omega}_{\Sigma}^{\mathcal{A}}(\text{FiFam}^{\mathcal{I}^{\mathbf{K}, \top}}(\mathcal{A})) \quad (\text{Fregeanity}) \\
 &= \Omega_{\Sigma}^{\mathcal{A}}(\{\top^{\mathcal{A}}\}) \quad (\text{protoalgebraicity}) \\
 &= \Delta_{\Sigma}^{\mathcal{A}}.
 \end{aligned}$$

We conclude that $\phi = \psi$ and, therefore, $\mathbf{K}$ is also congruence orderable. ■

To conclude the section, we would like to prove the converse of Theorem 1811, i.e., that, if $\mathbf{K}$ is a Fregean class of $\mathbf{F}$ -algebraic systems, then the assertional π -institution $\mathcal{I}^{\mathbf{K}, \text{top}}$ of $\mathbf{K}$ is a Fregean, protoalgebraic π -institution with $\top^b$ a natural theorem. Parts of the conclusion, we have already obtained in Theorem 1393. To obtain the full conclusion, we work towards the only remaining subgoal, expressed in the following proposition.

Proposition 1812 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a $\top^b$ -pointed class of $\mathbf{F}$ -algebraic systems. If $\mathbf{K}$ is Fregean, then the assertional π -institution $\mathcal{I}^{\mathbf{K}, \top} = \langle \mathbf{F}, C^{\mathbf{K}, \top} \rangle$ of $\mathbf{K}$ is Fregean.*

Proof: Suppose $\mathbf{K}$ is a Fregean quasivariety of $\mathbf{F}$ -algebraic systems, i.e., relatively point regular and congruence orderable. We must show that, for all $T \in \text{ThFam}(\mathcal{I}^{\mathbf{K}, \top})$, $\tilde{\Lambda}^{\mathcal{I}^{\mathbf{K}, \top}}(T) = \tilde{\Omega}^{\mathcal{I}^{\mathbf{K}, \top}}(T)$. Let $T \in \text{ThFam}(\mathcal{I}^{\mathbf{K}, \top})$. Since $\tilde{\Omega}^{\mathcal{I}^{\mathbf{K}, \top}}(T) \leq \tilde{\Lambda}^{\mathcal{I}^{\mathbf{K}, \top}}(T)$ always holds, it suffices to show the reverse inclusion, i.e., that $\tilde{\Lambda}^{\mathcal{I}^{\mathbf{K}, \top}}(T) \leq \tilde{\Omega}^{\mathcal{I}^{\mathbf{K}, \top}}(T)$. Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{SEN}^b(\Sigma)$, such that $\langle \phi, \psi \rangle \notin \tilde{\Omega}_{\Sigma}^{\mathcal{I}^{\mathbf{K}, \top}}(T)$. Equivalently, $\phi / \tilde{\Omega}_{\Sigma}^{\mathcal{I}^{\mathbf{K}, \top}}(T) \neq \psi / \tilde{\Omega}_{\Sigma}^{\mathcal{I}^{\mathbf{K}, \top}}(T)$. Let us denote, for the sake of brevity $\theta := \tilde{\Omega}^{\mathcal{I}^{\mathbf{K}, \top}}(T)$. Then, by Lemma 1388 and Proposition 1389, $\mathcal{F}/\theta \in \mathbf{K}$. Thus, by congruence orderability, there exists $\Sigma' \in |\mathbf{Sign}^b|$ and $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, such that

$$\Theta^{\mathbf{K}, \mathcal{F}/\theta}(\text{SEN}^b(f)(\phi) / \theta_{\Sigma'}, \top_{\Sigma'}^{\mathcal{F}/\theta}) \neq \Theta^{\mathbf{K}, \mathcal{F}/\theta}(\text{SEN}^b(f)(\psi) / \theta_{\Sigma'}, \top_{\Sigma'}^{\mathcal{F}/\theta}).$$

Thus, by relative point regularity, we must have

$$\top_{\Sigma'}^{\mathcal{F}/\theta} / \Theta^{\mathbf{K}, \mathcal{F}/\theta}(\text{SEN}^b(f)(\phi) / \theta_{\Sigma'}, \top_{\Sigma'}^{\mathcal{F}/\theta}) \neq \top_{\Sigma'}^{\mathcal{F}/\theta} / \Theta^{\mathbf{K}, \mathcal{F}/\theta}(\text{SEN}^b(f)(\psi) / \theta_{\Sigma'}, \top_{\Sigma'}^{\mathcal{F}/\theta}).$$

This gives that

$$C_{\Sigma}^{\mathbf{K}, \top}(\text{SEN}^b(f)(\phi), \top_{\Sigma'}^b / \Omega_{\Sigma'}(T)) \neq C_{\Sigma}^{\mathbf{K}, \top}(\text{SEN}^b(f)(\psi), \top_{\Sigma'}^b / \Omega_{\Sigma'}(T)),$$

which translates to $\langle \phi, \psi \rangle \notin \tilde{\Lambda}_{\Sigma}^{\mathcal{I}^{\mathbf{K}, \top}}(T)$. We conclude that $\mathcal{I}^{\mathbf{K}, \top}$ is Fregean. ■

Finally, putting this together, we get

Theorem 1813 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a $\top^b$ -pointed class of $\mathbf{F}$ -algebraic systems. If $\mathbf{K}$ is Fregean, then $\mathcal{I}^{\mathbf{K}, \top} = \langle \mathbf{F}, C^{\mathbf{K}, \top} \rangle$ is a Fregean, protoalgebraic π -institution, with $\top^b$ a natural theorem.*

Proof: By Proposition 1385, τ^b is a natural theorem of $\mathcal{I}^{K,\tau}$. By Proposition 1389, $\mathcal{I}^{K,\tau}$ is protoalgebraic. Finally, by Proposition 1812, $\mathcal{I}^{K,\tau}$ is Fregean.

■

The main result proven in this section is summarized in

Theorem 1814 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a τ^b -pointed class of $\mathbf{F}$ -algebraic systems. $\mathbf{K}$ is Fregean if and only if $\mathcal{I}^{K,\tau} = \langle \mathbf{F}, C^{K,\tau} \rangle$ is a Fregean, protoalgebraic π -institution, with τ^b a natural theorem.*

Proof: The “if” by Theorem 1811. The “only if” by Theorem 1813.

Chapter 24

Special Topics

24.1 Rule Based π -Institutions

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be a base algebraic system.

An **F-rule** is a pair $\langle P, \rho \rangle$, where $P \cup \{\rho\} : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ is a finite set of natural transformations in N^b . If $P = \emptyset$, then $\langle \emptyset, \rho \rangle$ is called an **F-axiom** and it is ordinarily identified with ρ .

Let $R = \langle P, \rho \rangle$ be an **F-rule**, $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$. We say ϕ **R-follows from** Φ , written $\Phi \rightarrow_\Sigma^R \phi$, if there exists $\bar{\chi} \in \mathbf{SEN}^b(\Sigma)$, such that

$$P_\Sigma(\bar{\chi}) \subseteq \Phi \quad \text{and} \quad \rho_\Sigma(\bar{\chi}) = \phi.$$

Consider, now, a set $\mathcal{R}$ of **F-rules**. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$, we say ϕ is **$\mathcal{R}$ -provable from** Φ , written $\phi \in C_\Sigma^\mathcal{R}(\Phi)$ or $\Phi \vdash_\Sigma^\mathcal{R} \phi$, if there exists a sequence

$$\phi_0, \phi_1, \phi_2, \dots, \phi_{n-1}, \phi_n$$

in $\mathbf{SEN}^b(\Sigma)$, such that $\phi_n = \phi$ and, for all $i \leq n$,

- $\phi_i \in \Phi$ or
- ϕ_i **R-follows from** $\{\phi_0, \phi_1, \dots, \phi_{i-1}\}$, for some $R \in \mathcal{R}$.

A sequence $\phi_0, \phi_1, \dots, \phi_n$ witnessing $\Phi \vdash_\Sigma^\mathcal{R} \phi$ is called an **$\mathcal{R}$ -proof** of ϕ from Φ .

We show that $C^\mathcal{R}$, as defined here, is indeed a closure system on the base algebraic system $\mathbf{F}$.

Proposition 1815 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{R}$ a collection of **F-rules**. Then $C^\mathcal{R} = \{C_\Sigma^\mathcal{R}\}_{\Sigma \in |\mathbf{Sign}^b|}$ is a closure system on $\mathbf{F}$.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \Psi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$.

- (i) If $\phi \in \Phi$, then ϕ is an $\mathcal{R}$ -proof of ϕ from Φ . So $\phi \in C_\Sigma^\mathcal{R}(\Phi)$ and $C^\mathcal{R}$ is inflationary.
- (ii) If $\Phi \subseteq \Psi$ and $\phi \in C_\Sigma^\mathcal{R}(\Phi)$, then, there exists an $\mathcal{R}$ -proof of ϕ from Φ . The same sequence is then an $\mathcal{R}$ -proof of ϕ from Ψ . So $\phi \in C_\Sigma^\mathcal{R}(\Psi)$ and $C^\mathcal{R}$ is monotone.
- (iii) Suppose $\phi \in C_\Sigma^\mathcal{R}(C_\Sigma^\mathcal{R}(\Phi))$. Then, there exists an $\mathcal{R}$ -proof of ϕ from $C_\Sigma^\mathcal{R}(\Phi)$, say

$$\phi_0, \phi_1, \dots, \phi_{n-1}, \phi_n = \phi.$$

Then, for each $\phi_i \in C_\Sigma^\mathcal{R}(\Phi)$, there exists an $\mathcal{R}$ -proof of ϕ_i from Φ . For each such ϕ_i , we insert its $\mathcal{R}$ -proof from Φ in its place in the sequence. The new sequence is an $\mathcal{R}$ -proof of ϕ from Φ . Thus, we get that $\phi \in C_\Sigma^\mathcal{R}(\Phi)$ and $C^\mathcal{R}$ is also idempotent.

- (iv) Finally, it remains to show structurality. Let $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, such that $\phi \in C_{\Sigma}^{\mathcal{R}}(\Phi)$. Let $\phi_0, \phi_1, \dots, \phi_{n-1}, \phi_n = \phi$ be an $\mathcal{R}$ -proof of ϕ from Φ . We consider the sequence

$$\text{SEN}^b(f)(\phi_0), \text{SEN}^b(f)(\phi_1), \dots, \text{SEN}^b(f)(\phi_{n-1}), \text{SEN}^b(f)(\phi_n).$$

Then $\text{SEN}^b(f)(\phi_n) = \text{SEN}^b(f)(\phi)$ and, moreover, for all $i \leq n$, if $\phi_i \in \Phi$, then $\text{SEN}^b(f)(\phi_i) \in \text{SEN}^b(f)(\Phi)$, and, if ϕ_i R -follows from $\{\phi_0, \phi_1, \dots, \phi_{i-1}\}$, for some $R \in \mathcal{R}$, then $\text{SEN}^b(f)(\phi_i)$ R -follows from $\{\text{SEN}^b(f)(\phi_0), \text{SEN}^b(f)(\phi_1), \dots, \text{SEN}^b(f)(\phi_{i-1})\}$ because of the naturality of R . So, the displayed sequence is an $\mathcal{R}$ -proof of $\text{SEN}^b(f)(\phi)$ from $\text{SEN}^b(f)(\Phi)$ and $C^{\mathcal{R}}$ is also structural.

We conclude that $C^{\mathcal{R}}$ is a closure system on $\mathbf{F}$. ■

We denote by $\mathcal{I}^{\mathcal{R}} = \langle \mathbf{F}, C^{\mathcal{R}} \rangle$ the π -institution corresponding to $C^{\mathcal{R}}$.

In general, given a π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$, we say that $\mathcal{I}$ is **rule based** if there exists a collection $\mathcal{R}$ of $\mathbf{F}$ -rules, such that $C = C^{\mathcal{R}}$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{R}$ a collection of $\mathbf{F}$ -rules, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$, an $\mathbf{F}$ -algebraic system and $T \in \text{SenFam}(\mathcal{A})$. We say that T is **closed under $\mathcal{R}$** or is **$\mathcal{R}$ -closed** if, for all $R = \langle P, \rho \rangle \in \mathcal{R}$, all $\Sigma \in |\mathbf{Sign}|$ and all $\tilde{\chi} \in \text{SEN}(\Sigma)$,

$$P_{\Sigma}^{\mathcal{A}}(\tilde{\chi}) \subseteq T_{\Sigma} \quad \text{implies} \quad \rho_{\Sigma}^{\mathcal{A}}(\tilde{\chi}) \in T_{\Sigma}.$$

This terminology allows the following elegant characterization of $\mathcal{I}^{\mathcal{R}}$ -filter families of $\mathcal{A}$.

Proposition 1816 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{R}$ a collection of $\mathbf{F}$ -rules, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$, an $\mathbf{F}$ -algebraic system and $T \in \text{SenFam}(\mathcal{A})$. Then $T \in \text{FiFam}^{\mathcal{I}^{\mathcal{R}}}(\mathcal{A})$ if and only if T is $\mathcal{R}$ -closed.*

Proof: Assume, first, that $T \in \text{FiFam}^{\mathcal{I}^{\mathcal{R}}}(\mathcal{A})$, $R = \langle P, \rho \rangle \in \mathcal{R}$ and, using surjectivity of $\langle F, \alpha \rangle$, let $\Sigma \in |\mathbf{Sign}^b|$ and $\tilde{\chi} \in \text{SEN}^b(\Sigma)$, such that

$$P_{F(\Sigma)}^{\mathcal{A}}(\alpha_{\Sigma}(\tilde{\chi})) \subseteq T_{F(\Sigma)}.$$

Then we get $\alpha_{\Sigma}(P_{\Sigma}(\tilde{\chi})) \subseteq T_{F(\Sigma)}$. Since, by the definition of $C^{\mathcal{I}^{\mathcal{R}}}$, $\rho_{\Sigma}(\tilde{\chi}) \in C_{\Sigma}^{\mathcal{I}^{\mathcal{R}}}(P_{\Sigma}(\tilde{\chi}))$ and, by hypothesis, $T \in \text{FiFam}^{\mathcal{I}^{\mathcal{R}}}(\mathcal{A})$, we get $\alpha_{\Sigma}(\rho_{\Sigma}(\tilde{\chi})) \in T_{F(\Sigma)}$ or, equivalently, $\rho_{F(\Sigma)}^{\mathcal{A}}(\alpha_{\Sigma}(\tilde{\chi})) \in T_{F(\Sigma)}$. Thus, T is $\mathcal{R}$ -closed.

Suppose, conversely, that $T \in \text{SenFam}(\mathcal{A})$ is $\mathcal{R}$ -closed. Let $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, such that $\phi \in C_{\Sigma}^{\mathcal{I}^{\mathcal{R}}}(\Phi)$ and consider $\Sigma' \in |\mathbf{Sign}^b|$ and $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, such that

$$\alpha_{\Sigma'}(\text{SEN}^b(f)(\Phi)) \subseteq T_{F(\Sigma')}.$$

Since $\phi \in C_{\Sigma}^{\mathcal{I}^{\mathcal{R}}}(\Phi)$, there exists an $\mathcal{R}$ -proof of ϕ from Φ , say

$$\phi_0, \phi_1, \dots, \phi_{n-1}, \phi_n = \phi.$$

We prove by induction on $i \leq n$ that, every member of the sequence

$$\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_0)), \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_1)), \dots, \\ \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_{n-1})), \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_n))$$

belongs to $T_{F(\Sigma')}$. The case $i = n$, will yield the desired conclusion.

First, if $\phi_i \in \Phi$, then $\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_i)) \in \alpha_{\Sigma'}(\text{SEN}^b(f)(\Phi)) \subseteq T_{F(\Sigma')}$, where the latter inclusion holds by hypothesis.

Suppose, on the other hand, that ϕ_i R -follows from $\{\phi_0, \phi_1, \dots, \phi_{i-1}\}$, for some $R = \langle P, \rho \rangle \in \mathcal{R}$. Thus, there exists $\vec{\chi} \in \text{SEN}^b(\Sigma)$, such that

$$P_{\Sigma}(\vec{\chi}) \subseteq \{\phi_0, \phi_1, \dots, \phi_{i-1}\} \quad \text{and} \quad \rho_{\Sigma}(\vec{\chi}) = \phi_i.$$

But then

$$\begin{aligned} P_{F(\Sigma')}^{\mathcal{A}}(\alpha_{\Sigma'}(\text{SEN}^b(f)(\vec{\chi}))) &= \alpha_{\Sigma'}(\text{SEN}^b(f)(P_{\Sigma}(\vec{\chi}))) \\ &\subseteq \alpha_{\Sigma'}(\text{SEN}^b(f)(\{\phi_0, \dots, \phi_{i-1}\})) \\ &\subseteq T_{F(\Sigma')}, \end{aligned}$$

where the last inclusion follows by the induction hypothesis, and, hence, since T is $\mathcal{R}$ -closed, we get that $\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_i)) = \alpha_{\Sigma'}(\text{SEN}^b(f)(\rho_{\Sigma}(\vec{\chi}))) = \rho_{F(\Sigma')}^{\mathcal{A}}(\alpha_{\Sigma'}(\text{SEN}^b(f)(\vec{\chi}))) \in T_{F(\Sigma')}$. This concludes the induction step and shows that, for all $i \leq n$, $\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_i)) \in T_{F(\Sigma')}$. $\blacksquare$

In addition, we can characterize $\mathcal{I}^{\mathcal{R}}$ -filter families generated by a given sentence family as follows.

Proposition 1817 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{R}$ a collection of $\mathbf{F}$ -rules, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$, an $\mathbf{F}$ -algebraic system and $X \in \text{SenFam}(\mathcal{A})$. Then, for all $\Sigma \in |\mathbf{Sign}|$,*

$$C_{\Sigma}^{\mathcal{I}^{\mathcal{R}}, \mathcal{A}}(X) = \{\phi \in \text{SEN}(\Sigma) : X_{\Sigma} \vdash_{\Sigma}^{\mathcal{R}} \phi\}.$$

Proof: Define $T = \{T_{\Sigma}\}_{\Sigma \in |\mathbf{Sign}|}$, by letting, for all $\Sigma \in |\mathbf{Sign}|$,

$$T_{\Sigma} = \{\phi \in \text{SEN}(\Sigma) : X_{\Sigma} \vdash_{\Sigma}^{\mathcal{R}} \phi\}.$$

It is not difficult to see that $X \leq T$ and T is $\mathcal{R}$ -closed. Thus, by Proposition 1816, $C^{\mathcal{I}^{\mathcal{R}}, \mathcal{A}}(X) \leq T$. On the other hand, if $T' \in \text{SenFam}(\mathcal{I})$ contains X and is $\mathcal{R}$ -closed, then $T \leq T'$. Therefore, we conclude that $T \leq C^{\mathcal{I}^{\mathcal{R}}, \mathcal{A}}(X)$. Equality now follows. $\blacksquare$

24.2 Operators on Classes of Matrix Families

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be a base algebraic system. Recall that an $\mathbf{F}$ -algebraic system is a pair $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, where $\mathbf{A} = \langle \mathbf{Sign}, \mathbf{SEN}, N \rangle$ is an N^b -algebraic system and $\langle F, \alpha \rangle : \mathbf{F} \rightarrow \mathbf{A}$ is a surjective N^b -algebraic system morphism. Recall, also, that an $\mathbf{F}$ -matrix family is a pair $\mathfrak{A} = \langle \mathcal{A}, T \rangle$, where $\mathcal{A}$ is an $\mathbf{F}$ -algebraic system and $T \in \mathbf{SenFam}(\mathbf{A})$ is a sentence family on $\mathbf{A}$.

We define now some class operators on classes of $\mathbf{F}$ -matrix families, i.e., operators that, given, as input a class of $\mathbf{F}$ -matrix families, produce a new class of $\mathbf{F}$ -matrix families.

Given $\mathbf{F}$ -algebraic systems $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$, and $\mathbf{F}$ -matrix families $\mathfrak{A} = \langle \mathcal{A}, T \rangle$ and $\mathfrak{B} = \langle \mathcal{B}, T' \rangle$, we say that $\mathfrak{B}$ is a **morphic image** of $\mathfrak{A}$ and write $\mathfrak{B} \in \mathbf{M}(\mathfrak{A})$, if there exists a surjective morphism $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ (that is, such that $\langle G, \beta \rangle = \langle H, \gamma \rangle \circ \langle F, \alpha \rangle$)

$$\begin{array}{ccc} & \mathbf{F} & \\ \langle F, \alpha \rangle \swarrow & & \searrow \langle G, \beta \rangle \\ \mathbf{A} & \xrightarrow{\langle H, \gamma \rangle} & \mathbf{B} \end{array}$$

such that

$$\gamma^{-1}(T') = T.$$

In this case, we call $\mathfrak{A}$ an **inverse morphic image** or a **morphic preimage** of $\mathfrak{B}$ and write $\mathfrak{A} \in \mathbf{M}^{-1}(\mathfrak{B})$.

Given a class $\mathbf{M}$ of $\mathbf{F}$ -matrix families, we write $\mathfrak{B} \in \mathbf{M}(\mathbf{M})$ if there exists $\mathfrak{A} \in \mathbf{M}$, such that $\mathfrak{B} \in \mathbf{M}(\mathfrak{A})$.

Similarly, we write $\mathfrak{A} \in \mathbf{M}^{-1}(\mathbf{M})$ if there exists $\mathfrak{B} \in \mathbf{M}$, such that $\mathfrak{A} \in \mathbf{M}^{-1}(\mathfrak{B})$.

It is not difficult to show that both $\mathbf{M}$ and $\mathbf{M}^{-1}$ are closure operators on the collection of all $\mathbf{F}$ -matrix families.

Lemma 1818 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. Then*

$$\mathbf{M}, \mathbf{M}^{-1} : \mathcal{P}(\mathbf{MatFam}(\mathbf{F})) \rightarrow \mathcal{P}(\mathbf{MatFam}(\mathbf{F}))$$

are closure operators on $\mathbf{MatFam}(\mathbf{F})$.

Proof: We prove the statement for $\mathbf{M}$ in detail. The proof for $\mathbf{M}^{-1}$ is similar.

Suppose, first, that $\mathbf{M}$ is a class of $\mathbf{F}$ -matrix families and $\mathfrak{A} \in \mathbf{M}$. Then, the diagram

$$\begin{array}{ccc} & \mathbf{F} & \\ \langle F, \alpha \rangle \swarrow & & \searrow \langle F, \alpha \rangle \\ \mathbf{A} & \xrightarrow{\langle I, \iota \rangle} & \mathbf{A} \end{array}$$

where $\langle I, \iota \rangle : \mathcal{A} \rightarrow \mathcal{A}$ is the identity morphism, shows that $\mathfrak{A} \in \mathbf{M}(\mathbf{M})$. Therefore, $\mathbf{M}$ is inflationary.

Monotonicity is obvious, since, if $\mathbf{M}, \mathbf{N}$ are classes of $\mathbf{F}$ -matrix families, such that $\mathbf{M} \subseteq \mathbf{N}$, and $\mathfrak{A} \in \mathbf{M}(\mathbf{M})$, then, by definition, $\mathfrak{A} \in \mathbf{M}(\mathfrak{B})$, with $\mathfrak{B} \in \mathbf{M}$. But then, since $\mathbf{M} \subseteq \mathbf{N}$, $\mathfrak{A} \in \mathbf{M}(\mathfrak{B})$, with $\mathfrak{B} \in \mathbf{N}$ and, again, by definition, $\mathfrak{A} \in \mathbf{M}(\mathbf{N})$. Thus, we have $\mathbf{M}(\mathbf{M}) \subseteq \mathbf{M}(\mathbf{N})$.

Finally, assume that $\mathbf{M}$ is a class of $\mathbf{F}$ -matrix families and $\mathfrak{A} \in \mathbf{M}(\mathbf{M}(\mathbf{M}))$. Then, there exists $\mathfrak{B} \in \mathbf{M}(\mathbf{M})$, such that $\mathfrak{A} \in \mathbf{M}(\mathfrak{B})$. Furthermore, there exists $\mathfrak{C} \in \mathbf{M}$, such that $\mathfrak{B} \in \mathbf{M}(\mathfrak{C})$. But these two statements combined reveal the existence of the following diagram, in which the two small triangles commute.

$$\begin{array}{ccccc}
 & & \mathbf{F} & & \\
 & \swarrow \langle H, \gamma \rangle & \downarrow \langle G, \beta \rangle & \searrow \langle F, \alpha \rangle & \\
 \mathbf{C} & \xrightarrow{\langle Q, q \rangle} & \mathbf{B} & \xrightarrow{\langle P, p \rangle} & \mathbf{A}
 \end{array}$$

As a result, the big triangle also commutes and this ensures that $\mathfrak{A} \in \mathbf{M}(\mathfrak{C})$, which yields $\mathfrak{A} \in \mathbf{M}(\mathbf{M})$. $\blacksquare$

Next, we introduce another class operator on classes of $\mathbf{F}$ -matrix families.

Let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system and $\mathfrak{A}^i = \langle \mathcal{A}, T^i \rangle$, $i \in I$, a collection of $\mathbf{F}$ -matrix families, all over $\mathcal{A}$. Define the **intersection** of the $\mathfrak{A}^i$, $i \in I$, as the $\mathbf{F}$ -matrix family, with the same underlying $\mathbf{F}$ -algebraic system $\mathcal{A}$ and with filter family the intersection of the T^i 's; more formally

$$\bigcap_{i \in I} \mathfrak{A}^i = \langle \mathcal{A}, \bigcap_{i \in I} T^i \rangle.$$

Given a class $\mathbf{M}$ of $\mathbf{F}$ -matrix families and an $\mathbf{F}$ -matrix family $\mathfrak{B}$, we write $\mathfrak{B} \in \mathbf{III}(\mathbf{M})$ if $\mathfrak{B}$ is the intersection of members of $\mathbf{M}$, i.e., $\mathfrak{B} = \bigcap_{i \in I} \mathfrak{A}^i$, with $\mathfrak{A}^i \in \mathbf{M}$, for all $i \in I$.

Again, it is not difficult to show that $\mathbf{III}$ is a closure operator on the collection of $\mathbf{F}$ -matrix families.

Lemma 1819 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. Then*

$$\mathbf{III} : \mathcal{P}(\mathbf{MatFam}(\mathbf{F})) \rightarrow \mathcal{P}(\mathbf{MatFam}(\mathbf{F}))$$

is a closure operator on $\mathbf{MatFam}(\mathbf{F})$.

Proof: To show inflationarity, notice that, trivially, for all $\mathfrak{A} \in \mathbf{M}$, $\mathfrak{A} = \bigcap \{\mathfrak{A}\}$, whence $\mathfrak{A} \in \mathbf{III}(\mathbf{M})$.

Monotonicity is straightforward, since, if $\mathbf{M} \subseteq \mathbf{N}$ and $\mathfrak{A} \in \mathbf{III}(\mathbf{M})$, then $\mathfrak{A} = \bigcap_{i \in I} \mathfrak{A}^i$, with $\mathfrak{A}^i \in \mathbf{M}$, for all $i \in I$, and, hence, $\mathfrak{A} = \bigcap_{i \in I} \mathfrak{A}^i$, with $\mathfrak{A}^i \in \mathbf{N}$, for all $i \in I$. So $\mathfrak{A} \in \mathbf{III}(\mathbf{N})$.

Finally, for transitivity, if $\mathfrak{A} \in \text{III}(\text{III}(\mathbf{M}))$, then $\mathfrak{A} = \bigcap_{i \in I} \mathfrak{A}^i$, where $\mathfrak{A}^i \in \text{III}(\mathbf{M})$, for all $i \in I$. Thus, for all $i \in I$, $\mathfrak{A}^i = \bigcap_{j \in J_i} \mathfrak{A}^{ij}$, where $\mathfrak{A}^{ij} \in \mathbf{M}$, for all $j \in J_i$. Therefore, we get

$$\mathfrak{A} = \bigcap_{i \in I} \mathfrak{A}^i = \bigcap_{i \in I} \bigcap_{j \in J_i} \mathfrak{A}^{ij},$$

where $\mathfrak{A}^{ij} \in \mathbf{M}$, for all $i \in I$, $j \in J_i$, and, hence, $\mathfrak{A} \in \text{III}(\mathbf{M})$. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a class of $\mathbf{F}$ -matrix families. Recall the closure system $C^{\mathbf{M}} : \mathcal{P}\text{SEN}^b \rightarrow \mathcal{P}\text{SEN}^b$ on $\mathbf{F}$ generated by $\mathbf{M}$. It is defined, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, by $\phi \in C_{\Sigma}^{\mathbf{M}}(\Phi)$ if and only if, for all $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \mathbf{M}$, all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\alpha_{\Sigma'}(\text{SEN}^b(f)(\Phi)) \subseteq T_{F(\Sigma')} \quad \text{implies} \quad \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \in T_{F(\Sigma')}.$$

$\mathcal{I}^{\mathbf{M}} = \langle \mathbf{F}, C^{\mathbf{M}} \rangle$ denotes the corresponding π -institution generated by $\mathbf{M}$.

Now, given a π -institution $\mathcal{I}$, one can consider its matrix family models, i.e., those $\mathbf{F}$ -matrix families $\mathfrak{A}$, such that

$$\mathcal{I} \leq \mathcal{I}^{\mathfrak{A}}.$$

Doing this for the specific π -institution $\mathcal{I}^{\mathbf{M}}$, generated by the class $\mathbf{M}$ of $\mathbf{F}$ -matrix families, we consider the class $\text{MatFam}(\mathcal{I}^{\mathbf{M}})$ of $\mathcal{I}^{\mathbf{M}}$ -matrix families. Clearly, since, for every $\mathfrak{A} \in \mathbf{M}$, $C^{\mathbf{M}} \leq C^{\mathfrak{A}}$,

$$\mathbf{M} \subseteq \text{MatFam}(\mathcal{I}^{\mathbf{M}}).$$

In the spirit of many classical problems in universal algebraic logic, the following question naturally arises:

Characterize $\text{MathFam}(\mathcal{I}^{\mathbf{M}})$, i.e., find a list of operators on classes of $\mathbf{F}$ -matrix families so that, when applied to $\mathbf{M}$ consecutively, they generate the class $\text{MatFam}(\mathcal{I}^{\mathbf{M}})$.

Our goal here is to show that the list of operators that are needed consists of MIIM^{-1} , i.e., that, given any class $\mathbf{M}$ of $\mathbf{F}$ -matrix families, we have

$$\text{MatFam}(\mathcal{I}^{\mathbf{M}}) = \text{MIIM}^{-1}(\mathbf{M}).$$

We start by showing that applying each of the three operators to classes of matrix family models of a π -institution $\mathcal{I}$ always results in classes of the same character.

Proposition 1820 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.*

- (a) $\mathbf{M}(\text{MatFam}(\mathcal{I})) \subseteq \text{MatFam}(\mathcal{I})$;
- (b) $\mathbf{III}(\text{MatFam}(\mathcal{I})) \subseteq \text{MatFam}(\mathcal{I})$;
- (c) $\mathbf{M}^{-1}(\text{MatFam}(\mathcal{I})) \subseteq \text{MatFam}(\mathcal{I})$.

Proof:

- (a) Let $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \text{MatFam}(\mathcal{I})$ and consider a surjective morphism $\langle H, \gamma \rangle : \mathfrak{A} \rightarrow \mathfrak{B}$, where $\mathfrak{B} = \langle \mathcal{B}, T' \rangle$, as in the diagram.

We now have

$$\beta^{-1}(T') = \alpha^{-1}(\gamma^{-1}(T')) = \alpha^{-1}(T) \in \text{ThFam}(\mathcal{I}),$$

where the last membership follows by the hypothesis and Lemma 51. Thus, again by Lemma 51, we get that $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and, hence, $\mathfrak{B} \in \text{MatFam}(\mathcal{I})$.

- (b) Suppose, next, that $\mathfrak{A}^i = \langle \mathcal{A}, T^i \rangle$, $i \in I$, are $\mathcal{I}$ -matrix families. Then $T^i \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, for all $i \in I$. Since the collection $\text{FiFam}^{\mathcal{I}}(\mathcal{A})$ forms a closure system on $\mathcal{A}$, it follows that $\bigcap_{i \in I} T^i \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Thus, we get that $\bigcap_{i \in I} \mathfrak{A}^i \in \text{MatFam}(\mathcal{I})$. So $\text{MatFam}(\mathcal{I})$ is closed under $\mathbf{III}$.
- (c) Let $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \text{MatFam}(\mathcal{I})$ and consider a surjective morphism $\langle H, \gamma \rangle : \mathfrak{B} \rightarrow \mathfrak{A}$, where $\mathfrak{B} = \langle \mathcal{B}, T' \rangle$, as in the diagram.

We now have

$$\beta^{-1}(T') = \beta^{-1}(\gamma^{-1}(T)) = \alpha^{-1}(T) \in \text{ThFam}(\mathcal{I}),$$

where the last membership follows by the hypothesis and Lemma 51. Thus, again by Lemma 51, we get that $T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$ and, hence, $\mathfrak{B} \in \text{MatFam}(\mathcal{I})$. ■

Proposition 1820 gives

Corollary 1821 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then*

$$\mathbf{MIIM}^{-1}(\text{MatFam}(\mathcal{I})) \subseteq \text{MatFam}(\mathcal{I}).$$

Proof: We have, using Proposition 1820,

$$\begin{aligned} \mathbf{MIIM}^{-1}(\text{MatFam}(\mathcal{I})) &\subseteq \mathbf{MII}(\text{MatFam}(\mathcal{I})) \\ &\subseteq \mathbf{M}(\text{MatFam}(\mathcal{I})) \\ &\subseteq \text{MatFam}(\mathcal{I}). \end{aligned}$$

■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Recall that a Lindenbaum $\mathcal{I}$ -matrix family is an $\mathcal{I}$ -matrix family of the form $\langle \mathcal{F}, T \rangle$, where $\mathcal{F} = \langle \mathbf{F}, \langle I, \iota \rangle \rangle$ and $T \in \text{ThFam}(\mathcal{I})$. We show, next, that the class of all $\mathcal{I}$ -matrix families can be obtained by applying the $\mathbf{M}$ operator on the class of all Lindenbaum matrix families, i.e., $\text{MatFam}(\mathcal{I}) = \mathbf{M}(\text{LMatFam}(\mathcal{I}))$.

Lemma 1822 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then*

$$\text{MatFam}(\mathcal{I}) = \mathbf{M}(\text{LMatFam}(\mathcal{I})).$$

Proof: First, observe that, since $\text{LMatFam}(\mathcal{I}) \subseteq \text{MatFam}(\mathcal{I})$, we have, by Proposition 1820,

$$\mathbf{M}(\text{LMatFam}(\mathcal{I})) \subseteq \mathbf{M}(\text{MatFam}(\mathcal{I})) \subseteq \text{MatFam}(\mathcal{I}).$$

Suppose, conversely, that $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \text{MatFam}(\mathcal{I})$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$. Then, we have, by Lemma 51, $\alpha^{-1}(T) \in \text{ThFam}(\mathcal{I})$. Hence, $\langle \mathcal{F}, \alpha^{-1}(T) \rangle \in \text{LMatFam}(\mathcal{I})$. Now, it suffices to consider the surjective morphism $\langle F, \alpha \rangle : \langle \mathcal{F}, \alpha^{-1}(T) \rangle \rightarrow \mathfrak{A}$

$$\begin{array}{ccc} & \mathbf{F} & \\ \langle I, \iota \rangle \swarrow & & \searrow \langle F, \alpha \rangle \\ \mathbf{F} & \xrightarrow{\langle F, \alpha \rangle} & \mathbf{A} \end{array}$$

to conclude that $\mathfrak{A} \in \mathbf{M}(\text{LMatFam}(\mathcal{I}))$. Therefore, we obtain $\text{MatFam}(\mathcal{I}) \subseteq \mathbf{M}(\text{LMatFam}(\mathcal{I}))$. ■

Now, to complete our task, we turn again to the specific π -institution $\mathcal{I}^{\mathbf{M}}$, generated by a given class $\mathbf{M}$ of $\mathbf{F}$ -matrix families. We show that all its Lindenbaum matrix families, i.e., all matrix families of the form $\langle \mathcal{F}, T \rangle$, where $T \in \text{ThFam}(\mathcal{I}^{\mathbf{M}})$, can be obtained by applying the operator $\mathbf{MIIM}^{-1}$ on the class $\mathbf{M}$.

Lemma 1823 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a collection of $\mathbf{F}$ -matrix families. Then*

$$\mathbf{LMatFam}(\mathcal{I}^{\mathbf{M}}) \subseteq \mathbf{IIIM}^{-1}(\mathbf{M}).$$

Proof: Let $\mathfrak{F} = \langle \mathcal{F}, T \rangle \in \mathbf{LMatFam}(\mathcal{I}^{\mathbf{M}})$, i.e., $T \in \mathbf{ThFam}(\mathcal{I}^{\mathbf{M}})$. Thus, there exist $\mathfrak{A}^i = \langle \mathcal{A}^i, T^i \rangle \in \mathbf{M}$, with $\mathcal{A} = \langle \mathbf{A}^i, \langle F^i, \alpha^i \rangle \rangle$, $i \in I$, such that

$$T = \bigcap_{i \in I} (\alpha^i)^{-1}(T^i).$$

Consider the collection $\mathfrak{F}^i = \langle \mathcal{F}, (\alpha^i)^{-1}(T^i) \rangle$, $i \in I$. Taking into account the surjective morphisms $\langle F^i, \alpha^i \rangle : \mathfrak{F}^i \rightarrow \mathfrak{A}^i$, $i \in I$, and the fact that $\mathfrak{A}^i \in \mathbf{M}$, we conclude that $\mathfrak{F}^i \in \mathbf{M}^{-1}(\mathbf{M})$, for all $i \in I$. Finally, observing that $\mathfrak{F} = \bigcap_{i \in I} \mathfrak{F}^i$, we get that $\mathfrak{F} \in \mathbf{IIIM}^{-1}(\mathbf{M})$. Therefore, $\mathbf{LMatFam}(\mathcal{I}^{\mathbf{M}}) \subseteq \mathbf{IIIM}^{-1}(\mathbf{M})$. ■

Now we are ready to provide the promised characterization of $\mathbf{MatFam}(\mathcal{I}^{\mathbf{M}})$ in terms of $\mathbf{M}$ and the class operators $\mathbf{M}$, $\mathbf{II}$ and $\mathbf{M}^{-1}$, introduced in this section.

Theorem 1824 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a collection of $\mathbf{F}$ -matrix families. Then*

$$\mathbf{MatFam}(\mathcal{I}^{\mathbf{M}}) = \mathbf{MIIIM}^{-1}(\mathbf{M}).$$

Proof: First, since $\mathbf{M} \subseteq \mathbf{MatFam}(\mathcal{I}^{\mathbf{M}})$, we have, using Corollary 1821,

$$\mathbf{MIIIM}^{-1}(\mathbf{M}) \subseteq \mathbf{MIIIM}^{-1}(\mathbf{MatFam}(\mathcal{I}^{\mathbf{M}})) \subseteq \mathbf{MatFam}(\mathcal{I}^{\mathbf{M}}).$$

Conversely, let $\mathfrak{A} \in \mathbf{MatFam}(\mathcal{I}^{\mathbf{M}})$. Then, by Lemmas 1822 and 1823,

$$\mathfrak{A} \in \mathbf{M}(\mathbf{LMatFam}(\mathcal{I}^{\mathbf{M}})) \subseteq \mathbf{MIIIM}^{-1}(\mathbf{M}).$$

Therefore, $\mathbf{MatFam}(\mathcal{I}^{\mathbf{M}}) \subseteq \mathbf{MIIIM}^{-1}(\mathbf{M})$. ■

As a consequence of this characterization, we can also show that the operator $\mathbf{MIIIM}^{-1}$ is a closure operator on classes of $\mathbf{F}$ -matrix families and, moreover, given any such class $\mathbf{M}$, applying the operator to the class results in the smallest class of $\mathbf{F}$ -matrix systems that contains $\mathbf{M}$ and is closed under the operations $\mathbf{M}$, $\mathbf{II}$ and $\mathbf{M}^{-1}$.

Theorem 1825 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a collection of $\mathbf{F}$ -matrix families.*

- (a) $\mathbf{MIIIM}^{-1} : \mathcal{P}(\mathbf{MatFam}(\mathbf{F})) \rightarrow \mathcal{P}(\mathbf{MatFam}(\mathbf{F}))$ is a closure operator;
- (b) $\mathbf{MIIIM}^{-1}(\mathbf{M})$ is the smallest class of $\mathbf{F}$ -matrix families containing $\mathbf{M}$ and closed under the operators $\mathbf{M}$, $\mathbf{II}$ and $\mathbf{M}^{-1}$.

Proof:

- (a) Inflationarity and monotonicity follow from the corresponding properties of the three operators, which were established in Lemmas 1818 and 1819. For idempotency, we have

$$\begin{aligned}
 \text{MIIM}^{-1}(\text{MIIM}^{-1}(\mathbf{M})) &= \text{MIIM}^{-1}(\text{MatFam}(\mathcal{I}^{\mathbf{M}})) \\
 &\quad (\text{by Theorem 1824}) \\
 &\subseteq \text{MatFam}(\mathcal{I}^{\mathbf{M}}) \\
 &\quad (\text{by Corollary 1821}) \\
 &= \text{MIIM}^{-1}(\mathbf{M}). \\
 &\quad (\text{again by Theorem 1824})
 \end{aligned}$$

- (b) By Part (a), $\mathbf{M} \subseteq \text{MIIM}^{-1}(\mathbf{M})$. Moreover, if $\mathbf{O} \in \{\mathbf{M}, \mathbf{II}, \mathbf{M}^{-1}\}$, then

$$\begin{aligned}
 \mathbf{O}(\text{MIIM}^{-1}(\mathbf{M})) &= \mathbf{O}(\text{MatFam}(\mathcal{I}^{\mathbf{M}})) \quad (\text{by Theorem 1824}) \\
 &\subseteq \text{MatFam}(\mathcal{I}^{\mathbf{M}}) \quad (\text{by Corollary 1821}) \\
 &= \text{MIIM}^{-1}(\mathbf{M}). \quad (\text{by Theorem 1824})
 \end{aligned}$$

Hence, $\text{MIIM}^{-1}(\mathbf{M})$ is closed under all three operators. If $\mathbf{N}$ is a class of $\mathbf{F}$ -matrix families such that $\mathbf{M} \subseteq \mathbf{N}$ and $\mathbf{N}$ closed under the three operators, then, clearly, $\text{MIIM}^{-1}(\mathbf{M}) \subseteq \text{MIIM}^{-1}(\mathbf{N}) = \mathbf{N}$. Therefore, $\text{MIIM}^{-1}(\mathbf{M})$ is the smallest class satisfying these properties. ■

24.3 Classes of Reduced Matrix Families

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Recall that $\text{LMatFam}^*(\mathcal{I})$ is the class of all reduced Lindenbaum $\mathcal{I}$ -matrix families, i.e., all $\mathbf{F}$ -matrix families of the form $\langle \mathcal{F}^{\Omega(T)}, T/\Omega(T) \rangle$, where $\mathcal{F} = \langle \mathbf{F}, \langle I, \iota \rangle \rangle$ and $T \in \text{ThFam}(\mathcal{I})$, and that $\mathcal{I}$ is complete with respect to $\text{LMatFam}^*(\mathcal{I})$.

Recall, also, that $\text{MatFam}^*(\mathcal{I})$ is the collection of all reduced $\mathcal{I}$ -matrix families, i.e., $\mathbf{F}$ -matrix families of the form $\langle \mathcal{A}, T \rangle$, where $\mathcal{A}$ is an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $\Omega^{\mathcal{A}}(T) = \Delta^{\mathcal{A}}$. Moreover, $\mathcal{I}$ is also complete with respect to $\text{MatFam}^*(\mathcal{I})$.

Our first goal is to show that the class $\text{MatFam}^*(\mathcal{I})$ is, in fact, the class generated by applying the morphic image operator $\mathbf{M}$, introduced in the previous section, on the class $\text{LMatFam}^*(\mathcal{I})$.

We prove, first, that the operator

$$\mathbf{M} : \mathcal{P}(\text{MatFam}^*(\mathbf{F})) \rightarrow \mathcal{P}(\text{MatFam}^*(\mathbf{F})),$$

i.e., the operator $\mathbf{M}$, introduced in Section 24.2, restricted to reduced $\mathbf{F}$ -matrix families, is also a closure operator.

Proposition 1826 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. Then*

$$\mathbf{M} : \mathcal{P}(\text{MatFam}^*(\mathbf{F})) \rightarrow \mathcal{P}(\text{MatFam}^*(\mathbf{F}))$$

is a closure operator on $\text{MatFam}^*(\mathbf{F})$.

Proof: Since we know, by Lemma 1818, that $\mathbf{M}$ is inflationary, monotone and idempotent, it suffices to show that it is well-defined, i.e., that, when applied to collections of reduced $\mathbf{F}$ -matrix families, it produces collections of the same kind. In turn, it suffices to show that, given a reduced $\mathbf{F}$ -matrix family $\mathfrak{A} = \langle \mathcal{A}, T \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, an $\mathbf{F}$ -matrix family $\mathfrak{A}' = \langle \mathcal{A}', T' \rangle$, with $\mathcal{A}' = \langle \mathbf{A}', \langle F', \alpha' \rangle \rangle$, and a strict surjective morphism $\langle H, \gamma \rangle : \mathfrak{A} \rightarrow \mathfrak{A}'$, then $\mathfrak{A}'$ is also reduced.

$$\begin{array}{ccc} & \mathbf{F} & \\ \langle F, \alpha \rangle \swarrow & & \searrow \langle F', \alpha' \rangle \\ \mathbf{A} & \xrightarrow{\langle H, \gamma \rangle} & \mathbf{A}' \end{array}$$

Taking into account the surjectivity of $\langle F', \alpha' \rangle$, we reason as follows. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$, we have

$$\begin{aligned} \langle \alpha'_\Sigma(\phi), \alpha'_\Sigma(\psi) \rangle &\in \Omega_{F'(\Sigma)}^{\mathcal{A}'}(T') \\ \text{iff } \langle \gamma_{F(\Sigma)}(\alpha_\Sigma(\phi)), \gamma_{F(\Sigma)}(\alpha_\Sigma(\psi)) \rangle &\in \Omega_{G(F(\Sigma))}^{\mathcal{A}'}(T') \\ \text{iff } \langle \alpha_\Sigma(\phi), \alpha_\Sigma(\psi) \rangle &\in \gamma_{F(\Sigma)}^{-1}(\Omega_{G(F(\Sigma))}^{\mathcal{A}'}(T')) \\ \text{iff } \langle \alpha_\Sigma(\phi), \alpha_\Sigma(\psi) \rangle &\in \Omega_{F(\Sigma)}^{\mathcal{A}}(\gamma^{-1}(T')) \\ \text{iff } \langle \alpha_\Sigma(\phi), \alpha_\Sigma(\psi) \rangle &\in \Omega_{F(\Sigma)}^{\mathcal{A}}(T) \\ \text{iff } \langle \alpha_\Sigma(\phi), \alpha_\Sigma(\psi) \rangle &\in \Delta_{F(\Sigma)}^{\mathcal{A}}(T) \\ \text{iff } \alpha_\Sigma(\phi) &= \alpha_\Sigma(\psi) \\ \text{implies } \gamma_{F(\Sigma)}(\alpha_\Sigma(\phi)) &= \gamma_{F(\Sigma)}(\alpha_\Sigma(\psi)) \\ \text{iff } \alpha'_\Sigma(\phi) &= \alpha'_\Sigma(\psi). \end{aligned}$$

Therefore $\Omega^{\mathcal{A}'}(T') = \Delta^{\mathcal{A}'}$ and, hence $\mathfrak{A}'$ is also reduced. $\blacksquare$

Next, we show that, given π -institution $\mathcal{I}$, the class $\text{MatFam}^*(\mathcal{I})$ is obtained by applying the operator $\mathbf{M}$ on the class $\text{LMatFam}^*(\mathcal{I})$.

Proposition 1827 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then*

$$\text{MatFam}^*(\mathcal{I}) = \mathbf{M}(\text{LMatFam}^*(\mathcal{I})).$$

Proof: The inclusion $\mathbf{M}(\text{LMatFam}^*(\mathcal{I})) \subseteq \text{MatFam}^*(\mathcal{I})$ is obtained by observing that $\text{LMatFam}^*(\mathcal{I}) \subseteq \text{MatFam}^*(\mathcal{I})$ and applying $\mathbf{M}$:

$$\begin{aligned} \mathbf{M}(\text{LMatFam}^*(\mathcal{I})) &\subseteq \mathbf{M}(\text{MatFam}^*(\mathcal{I})) \quad (\text{Lemma 1818}) \\ &\subseteq \text{MatFam}^*(\mathcal{I}). \quad (\text{Propositions 1820 and 1826}) \end{aligned}$$

Suppose, conversely, that $\mathfrak{A} = \langle \mathcal{A}, T \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, is a reduced $\mathcal{I}$ -matrix family. Let $\theta = \text{Ker}(\langle F, \alpha \rangle)$ and consider the commutative diagram

$$\begin{array}{ccc} & \mathbf{F} & \\ \langle I, \pi^\theta \rangle \swarrow & & \searrow \langle F, \alpha \rangle \\ \mathbf{F}^\theta & \xrightarrow{\langle F, \alpha^\theta \rangle} & \mathbf{A} \end{array}$$

where, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$\alpha_\Sigma^\theta(\phi/\theta_\Sigma) = \alpha_\Sigma(\phi).$$

It now suffices to show that $\mathfrak{F} := \langle \mathcal{F}^\theta, \alpha^{-1}(T)/\theta \rangle \in \text{LMatFam}^*(\mathcal{I})$. First, note that since $\mathfrak{A} \in \text{MatFam}^*(\mathcal{I}) \subseteq \text{MatFam}(\mathcal{I})$, then

$$\mathfrak{F} \in \mathbb{M}^{-1}(\text{MatFam}(\mathcal{I})) \subseteq \text{MatFam}(\mathcal{I}),$$

by Proposition 1820. So it suffices to show that $\Omega^{\mathcal{F}^\theta}(\alpha^{-1}(T)/\theta) = \Delta^{\mathcal{F}^\theta}$. We have

$$\begin{aligned} \Omega^{\mathcal{F}^\theta}(\alpha^{-1}(T)/\theta) &= \Omega^{\mathcal{F}^\theta}((\alpha^\theta)^{-1}(T)) \\ &= (\alpha^\theta)^{-1}(\Omega^{\mathcal{A}}(T)) \\ &= (\alpha^\theta)^{-1}(\Delta^{\mathcal{A}}) \\ &= \text{Ker}(\langle F, \alpha^\theta \rangle) = \Delta^{\mathcal{F}^\theta}. \end{aligned}$$

Now we conclude that $\mathfrak{A} \in \mathbb{M}(\text{LMatFam}^*(\mathcal{I}))$. ■

Consider, again, a base algebraic system $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ and a collection $\mathbb{M}$ of reduce $\mathbf{F}$ -matrix families. We pose now a problem similar to that posed in Section 24.2, but for classes of reduced matrix families.

Characterize the class $\text{MatFam}^*(\mathcal{I})$, i.e., find a list of operators on classes of reduced $\mathbf{F}$ -matrix families so that, when applied to $\mathbb{M}$ consecutively, they generate the class $\text{MatFam}^*(\mathcal{I}^{\mathbb{M}})$.

Unlike the operator $\mathbb{M}$ that, when applied to reduced matrix families yields reduced matrix families, the other two operators that we considered in Section 24.2, namely $\mathbb{III}$ and $\mathbb{M}^{-1}$, do not share this property. So to “localize” them to reduced matrix families, we must take the output classes of $\mathbf{F}$ -matrix families that they produce and “reduce” them so that the output produced becomes a collection of reduced $\mathbf{F}$ -matrix families. According to this scheme, we consider the following operators, induced by the operators $\mathbb{III}$ and $\mathbb{M}^{-1}$ on class of matrix families, introduced in Section 24.2.

- $\mathbb{III}^* : \mathcal{P}(\text{MatFam}^*(\mathbf{F})) \rightarrow \mathcal{P}(\text{MatFam}^*(\mathbf{F}))$ is given, by setting, for all $\mathbb{M} \subseteq \text{MatFam}^*(\mathbf{F})$,

$$\mathbb{III}^*(\mathbb{M}) = \{\mathfrak{A}^* : \mathfrak{A} \in \mathbb{III}(\mathbb{M})\};$$

- $M^{-1*} : \mathcal{P}(\text{MatFam}^*(\mathbf{F})) \rightarrow \mathcal{P}(\text{MatFam}^*(\mathbf{F}))$ is given, by setting, for all $M \subseteq \text{MatFam}^*(\mathbf{F})$,

$$M^{-1*}(\mathbf{M}) = \{\mathfrak{A}^* : \mathfrak{A} \in M^{-1}(\mathbf{M})\}.$$

It is not very difficult to prove that both III^* and M^{-1*} are closure operators on the class of reduced $\mathbf{F}$ -matrix families.

Proposition 1828 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system. Then*

$$\text{III}^* : \mathcal{P}(\text{MatFam}^*(\mathbf{F})) \rightarrow \mathcal{P}(\text{MatFam}^*(\mathbf{F}))$$

is a closure operator on $\text{MatFam}^*(\mathbf{F})$.

Proof: Let $M \subseteq \text{MatFam}^*(\mathbf{F})$ and $\mathfrak{A} \in M$. Then, by Proposition 1819, $\mathfrak{A} \in \text{III}(M)$ and, as $\mathfrak{A}$ is reduced, we get $\mathfrak{A} \in \text{III}^*(M)$. Thus, III^* is inflationary.

Suppose, next, that $M \subseteq N \subseteq \text{MatFam}^*(\mathbf{F})$ and $\mathfrak{A} \in \text{III}^*(M)$. Then $\mathfrak{A} = (\bigcap_{i \in I} \mathfrak{A}^i)^*$, with $\mathfrak{A}^i \in M$, for all $i \in I$. But then, since $M \subseteq N$, $\mathfrak{A} = (\bigcap_{i \in I} \mathfrak{A}^i)^*$, with $\mathfrak{A}^i \in N$, for all $i \in I$, and, hence, $\mathfrak{A} \in \text{III}^*(N)$. Therefore III^* is also monotone.

Suppose, finally, that $M \subseteq \text{MatFam}^*(\mathbf{F})$ and that $\mathfrak{A} \in \text{III}^*(\text{III}^*(M))$. Then $\mathfrak{A} = (\bigcap_{i \in I} \mathfrak{A}^i)^*$, where $\mathfrak{A}^i \in \text{III}^*(M)$. Hence, for all $i \in I$, $\mathfrak{A}^i = (\bigcap_{j \in J_i} \mathfrak{A}^{ij})^*$, where $\mathfrak{A}^{ij} \in M$, for all $i \in I$ and all $j \in J_i$. Now note the following:

- For every $i \in I$, for $\bigcap_{j \in J_i} \mathfrak{A}^{ij}$ to be defined, we must have $\mathfrak{A}^{ij} = \langle \mathcal{A}^i, T^{ij} \rangle$, for all $j \in J_i$.
- For $\bigcap_{i \in I} \mathcal{A}^i = \bigcap_{i \in I} (\bigcap_{j \in J_i} \mathfrak{A}^{ij})^*$ to be defined, we must have, for all $i \in I$, $\mathcal{A}^i = \mathcal{A}$, for some $\mathbf{F}$ -algebraic system $\mathcal{A}$, and, moreover, for all $i \in I$, $\Omega^{\mathcal{A}}(\bigcap_{j \in J_i} T^{ij}) = \theta$, for some $\theta \in \text{ConSys}(\mathcal{A})$.

Under these restrictions, it is easy to show that

$$\langle I, \pi \rangle : \langle \mathcal{A}, \bigcap_{i \in I} \bigcap_{j \in J_i} T^{ij} \rangle \rightarrow \mathcal{A}^\theta / \Omega^{\mathcal{A}^\theta} (\bigcap_{i \in I} ((\bigcap_{j \in J_i} T^{ij}) / \theta))$$

defined, for all $\Sigma \in |\text{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$, by

$$\pi_\Sigma(\phi) = (\phi / \theta_\Sigma) / \Omega_\Sigma^{\mathcal{A}^\theta} (\bigcap_{i \in I} ((\bigcap_{j \in J_i} T^{ij}) / \theta)),$$

is a strict surjective matrix morphism, with kernel

$$\text{Ker}(\langle I, \pi \rangle) = \Omega^{\mathcal{A}} (\bigcap_{i \in I} \bigcap_{j \in J_i} T^{ij}).$$

Therefore, we get an isomorphism

$$\mathfrak{A} / \Omega^{\mathcal{A}} (\bigcap_{i \in I} \bigcap_{j \in J_i} T^{ij}) \cong (\mathfrak{A}^\theta) (\Omega^{\mathcal{A}^\theta} (\bigcap_{i \in I} ((\bigcap_{j \in J_i} T^{ij}) / \theta))).$$

We conclude that $\mathfrak{A} \in \text{III}^*(M)$ and, therefore, III^* is also idempotent. ■

To show that M^{-1*} is a closure operator, we employ a lemma to the effect that, given a class M of reduced $\mathbf{F}$ -matrix families, $M^{-1*}(M) \subseteq M^{-1}(M)$.

Lemma 1829 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. For every $\mathbf{F}$ -matrix family $\mathfrak{A} = \langle \mathcal{A}, T \rangle$, every reduced $\mathbf{F}$ -matrix family $\mathfrak{A}' = \langle \mathcal{A}', T' \rangle$ and strict surjective morphism $\langle H, \gamma \rangle : \mathfrak{A} \rightarrow \mathfrak{A}'$, there exists a strict surjective morphism $\langle H, \gamma^* \rangle : \mathfrak{A}^* \rightarrow \mathfrak{A}'$, such that the following triangle commutes,*

$$\begin{array}{ccc} \mathfrak{A} & \xrightarrow{\langle H, \gamma \rangle} & \mathfrak{A}' \\ & \searrow \langle I, \pi \rangle & \nearrow \langle H, \gamma^* \rangle \\ & \mathfrak{A}^* & \end{array}$$

where $\langle I, \pi \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^*$ is the quotient morphism.

Proof: We define $\gamma^* : \mathbf{SEN}^* \rightarrow \mathbf{SEN}' \circ H$ by setting, for all $\Sigma \in |\mathbf{Sign}|$, and all $\phi \in \mathbf{SEN}(\Sigma)$,

$$\gamma_{\Sigma}^*(\phi^*) = \gamma_{\Sigma}(\phi).$$

This makes sense, since, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$, such that $\phi^* = \psi^*$, we have $\langle \phi, \psi \rangle \in \Omega_{\Sigma}^A(T) = \Omega_{\Sigma}^A(\gamma^{-1}(T'))$, whence $\langle \phi, \psi \rangle \in \gamma_{\Sigma}^{-1}(\Omega_{H(\Sigma)}^{A'}(T'))$ and, hence, $\langle \gamma_{\Sigma}(\phi), \gamma_{\Sigma}(\psi) \rangle \in \Delta_{H(\Sigma)}^{A'}$, i.e., $\gamma_{\Sigma}(\phi) = \gamma_{\Sigma}(\psi)$.

Moreover, $\gamma : \mathbf{SEN}^* \rightarrow \mathbf{SEN} \circ H$ is a natural transformation, since, for all $\Sigma, \Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\phi \in \mathbf{SEN}(\Sigma)$,

$$\begin{array}{ccc} \mathbf{SEN}^*(\Sigma) & \xrightarrow{\gamma_{\Sigma}^*} & \mathbf{SEN}'(H(\Sigma)) \\ \mathbf{SEN}^*(f) \downarrow & & \downarrow \mathbf{SEN}'(H(f)) \\ \mathbf{SEN}^*(\Sigma') & \xrightarrow{\gamma_{\Sigma'}^*} & \mathbf{SEN}'(H(\Sigma')) \end{array}$$

$$\begin{aligned} \mathbf{SEN}'(H(f))(\gamma_{\Sigma}^*(\phi^*)) &= \mathbf{SEN}'(H(f))(\gamma_{\Sigma}(\phi)) \\ &= \gamma_{\Sigma'}(\mathbf{SEN}(f)(\phi)) \\ &= \gamma_{\Sigma'}^*(\mathbf{SEN}(f)(\phi)^*) \\ &= \gamma_{\Sigma'}^*(\mathbf{SEN}^*(g)(\phi^*)). \end{aligned}$$

Further, the triangle commutes, by the definition of $\langle H, \gamma^* \rangle$ and, finally, $\langle H, \gamma^* \rangle : \mathfrak{A}^* \rightarrow \mathfrak{A}'$ is strict since $\pi^{-1}((\gamma^*)^{-1}(T')) = \gamma^{-1}(T') = T$ and, therefore, $(\gamma^*)^{-1}(T') = \pi(T) = T^*$. $\blacksquare$

Now, we show $\mathbf{M}^{-1*}$ is a closure operator.

Proposition 1830 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. Then*

$$\mathbf{M}^{-1*} : \mathcal{P}(\mathbf{MatFam}^*(\mathbf{F})) \rightarrow \mathcal{P}(\mathbf{MatFam}^*(\mathbf{F}))$$

is a closure operator on $\mathbf{MatFam}^*(\mathbf{F})$.

Proof: Suppose, first, that $\mathbf{M} \subseteq \text{MatFam}^*(\mathbf{F})$ and $\mathfrak{A} \in \mathbf{M}$. Then, we have, by Proposition 1818, $\mathfrak{A} \in \mathbf{M}^{-1}(\mathbf{M})$ and, since $\mathfrak{A}$ is reduced, we get $\mathfrak{A} \in \mathbf{M}^{-1*}(\mathbf{M})$. So $\mathbf{M}^{-1*}$ is inflationary.

Suppose, next, that $\mathbf{M} \subseteq \mathbf{N} \subseteq \text{MatFam}^*(\mathbf{F})$ and $\mathfrak{A} \in \mathbf{M}^{-1*}(\mathbf{M})$. Then $\mathfrak{A} = \mathfrak{B}^*$, with $\mathfrak{B} \in \mathbf{M}^{-1}(\mathbf{M})$. Thus, by Proposition 1818, we get $\mathfrak{A} = \mathfrak{B}^*$, with $\mathfrak{B} \in \mathbf{M}^{-1}(\mathbf{N})$. We conclude that $\mathfrak{A} \in \mathbf{M}^{-1*}(\mathbf{N})$ and, therefore, $\mathbf{M}^{-1*}$ is also monotone.

Finally, suppose that $\mathbf{M} \subseteq \text{MatFam}^*(\mathbf{F})$ and that $\mathfrak{A} \in \mathbf{M}^{-1*}(\mathbf{M}^{-1*}(\mathbf{M}))$. Then, using Lemma 1829, we get

$$\mathfrak{A} \in \mathbf{M}^{-1*}(\mathbf{M}^{-1*}(\mathbf{M})) \subseteq \mathbf{M}^{-1}(\mathbf{M}^{-1*}(\mathbf{M})) \subseteq \mathbf{M}^{-1}(\mathbf{M}^{-1}(\mathbf{M})) \subseteq \mathbf{M}^{-1}(\mathbf{M}),$$

and, since $\mathfrak{A}$ is reduced, we get $\mathfrak{A} \in \mathbf{M}^{-1*}(\mathbf{M})$. Therefore $\mathbf{M}^{-1*}$ is also idempotent. $\blacksquare$

We need one more operator on reduced classes of $\mathbf{F}$ -matrix families.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. We define

$$\overleftarrow{\mathbf{III}}^* : \mathcal{P}(\text{MatFam}^*(\mathbf{F})) \rightarrow \mathcal{P}(\text{MatFam}^*(\mathbf{F}))$$

by setting, for all $\mathbf{M} \subseteq \text{MatFam}^*(\mathbf{F})$,

$$\overleftarrow{\mathbf{III}}^*(\mathbf{M}) = (\mathbf{IIIM}^{-1}(\mathbf{M}))^*.$$

Note that this operator dominates both $\mathbf{III}^*$ and $\mathbf{M}^{-1*}$.

Proposition 1831 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. Then, for all $\mathbf{M} \subseteq \text{MatFam}^*(\mathbf{F})$,*

$$\mathbf{III}^*(\mathbf{M}) \subseteq \overleftarrow{\mathbf{III}}^*(\mathbf{M}) \quad \text{and} \quad \mathbf{M}^{-1*}(\mathbf{M}) \subseteq \overleftarrow{\mathbf{III}}^*(\mathbf{M}).$$

Proof: The proofs of both statements are parallel. We have

$$\begin{aligned} \mathbf{III}^*(\mathbf{M}) &= (\mathbf{III}(\mathbf{M}))^* & \mathbf{M}^{-1}(\mathbf{M}) &= (\mathbf{M}^{-1}(\mathbf{M}))^* \\ &\subseteq (\mathbf{IIIM}^{-1}(\mathbf{M}))^* & &\subseteq (\mathbf{IIIM}^{-1}(\mathbf{M}))^* \\ &= \overleftarrow{\mathbf{III}}^*(\mathbf{M}) & &= \overleftarrow{\mathbf{III}}^*(\mathbf{M}) \end{aligned}$$

where the inclusions follow from Lemmas 1818 and 1819, respectively. $\blacksquare$

Our next goal is to show that the list of operators that are needed to obtain the class of all reduced $\mathcal{I}^{\mathbf{M}}$ -matrix families from a class $\mathbf{M}$ of reduced $\mathbf{F}$ -matrix families generating a closure operator $C^{\mathbf{M}}$ (of a π -institution $\mathcal{I}^{\mathbf{M}} = \langle \mathbf{F}, C^{\mathbf{M}} \rangle$) consists of $\overleftarrow{\mathbf{MIII}}^*$, i.e., that, given any class $\mathbf{M}$ of reduced $\mathbf{F}$ -matrix families, we have

$$\text{MatFam}^*(\mathcal{I}^{\mathbf{M}}) = \overleftarrow{\mathbf{MIII}}^*(\mathbf{M}).$$

We start by showing that applying each of these operators to classes of reduced matrix family models of a π -institution $\mathcal{I}$ always results in classes of the same character. This forms an analog of Proposition 1820.

Proposition 1832 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.*

- (a) $\mathbf{M}(\text{MatFam}^*(\mathcal{I})) \subseteq \text{MatFam}^*(\mathcal{I});$
- (b) $\overleftarrow{\text{III}}^*(\text{MatFam}^*(\mathcal{I})) \subseteq \text{MatFam}^*(\mathcal{I}).$

Proof:

- (a) We have

$$\begin{aligned}
 \mathbf{M}(\text{MatFam}^*(\mathcal{I})) &\subseteq \mathbf{M}(\text{MatFam}(\mathcal{I})) \cap \mathbf{M}(\text{MatFam}^*(\mathbf{F})) \\
 &\quad (\text{Proposition 1818}) \\
 &\subseteq \text{MatFam}(\mathcal{I}) \cap \text{MatFam}^*(\mathbf{F}) \\
 &\quad (\text{Propositions 1820 and 1826}) \\
 &= \text{MatFam}^*(\mathcal{I}). \quad (\text{Definition})
 \end{aligned}$$

- (b) Similarly,

$$\begin{aligned}
 \overleftarrow{\text{III}}^*(\text{MatFam}^*(\mathcal{I})) &= (\text{IIIM}^{-1}(\text{MatFam}^*(\mathcal{I})))^* \\
 &\subseteq (\text{IIIM}^{-1}(\text{MatFam}(\mathcal{I})))^* \\
 &\quad (\text{Lemmas 1818 and 1819}) \\
 &\subseteq (\text{MatFam}(\mathcal{I}))^* \\
 &\quad (\text{Proposition 1820}) \\
 &= \text{MatFam}^*(\mathcal{I}).
 \end{aligned}$$

■

Proposition 1832, together with Proposition 1820, give the following

Corollary 1833 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Then*

$$\overleftarrow{\text{MIII}}^*(\text{MatFam}^*(\mathcal{I})) \subseteq \text{MatFam}^*(\mathcal{I}).$$

Proof: We have, using Propositions 1820 and 1832,

$$\begin{aligned}
 \overleftarrow{\text{MIII}}^*(\text{MatFam}^*(\mathcal{I})) &\subseteq \mathbf{M}(\text{MatFam}^*(\mathcal{I})) \\
 &\subseteq \text{MatFam}^*(\mathcal{I}).
 \end{aligned}$$

■

In order to establish our final result, we must show that, given a class $\mathbf{M}$ of reduced $\mathbf{F}$ -matrix families, all reduced Lindenbaum matrix families of the π -institution $\mathcal{I}^{\mathbf{M}}$, i.e., all matrix families of the form $\langle \mathcal{F}/\Omega(T), T/\Omega(T) \rangle$, where $T \in \text{ThFam}(\mathcal{I}^{\mathbf{M}})$, can be obtained by applying the operator $\overleftarrow{\text{III}}^*$ on the class $\mathbf{M}$.

Lemma 1834 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a collection of reduced $\mathbf{F}$ -matrix families. Then*

$$\mathbf{LMatFam}^*(\mathcal{I}^{\mathbf{M}}) \subseteq \overleftarrow{\mathbf{M}}^*(\mathbf{M}).$$

Proof: we have

$$\begin{aligned} \mathbf{LMatFam}^*(\mathcal{I}^{\mathbf{M}}) &= (\mathbf{LMatFam}(\mathcal{I}^{\mathbf{M}}))^* \quad (\text{Definition}) \\ &\subseteq (\mathbf{MIM}^{-1}(\mathbf{M}))^* \quad (\text{Lemma 1823}) \\ &= \overleftarrow{\mathbf{M}}^*(\mathbf{M}). \quad (\text{Definition}) \end{aligned}$$

■

Now we provide the promised characterization of $\mathbf{MatFam}^*(\mathcal{I}^{\mathbf{M}})$ in terms of the class $\mathbf{M}$ of reduced $\mathbf{F}$ -matrix families and the class operators $\mathbf{M}$ and $\overleftarrow{\mathbf{M}}$.

Theorem 1835 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a collection of reduced $\mathbf{F}$ -matrix families. Then*

$$\mathbf{MatFam}^*(\mathcal{I}^{\mathbf{M}}) = \mathbf{M}\overleftarrow{\mathbf{M}}^*(\mathbf{M}).$$

Proof: First, since $\mathbf{M} \subseteq \mathbf{MatFam}^*(\mathcal{I}^{\mathbf{M}})$, we have, using Corollary 1833,

$$\mathbf{M}\overleftarrow{\mathbf{M}}^*(\mathbf{M}) \subseteq \mathbf{M}\overleftarrow{\mathbf{M}}^*(\mathbf{MatFam}^*(\mathcal{I}^{\mathbf{M}})) \subseteq \mathbf{MatFam}^*(\mathcal{I}^{\mathbf{M}}).$$

Conversely, let $\mathfrak{A} \in \mathbf{MatFam}^*(\mathcal{I}^{\mathbf{M}})$. Then, by Proposition 1827 and Lemma 1834,

$$\mathfrak{A} \in \mathbf{M}(\mathbf{LMatFam}^*(\mathcal{I}^{\mathbf{M}})) \subseteq \mathbf{M}\overleftarrow{\mathbf{M}}^*(\mathbf{M}).$$

Therefore, $\mathbf{MatFam}^*(\mathcal{I}^{\mathbf{M}}) \subseteq \mathbf{M}\overleftarrow{\mathbf{M}}^*(\mathbf{M})$, and equality follows. ■

As a consequence of this characterization, we can also show that the operator $\mathbf{M}\overleftarrow{\mathbf{M}}^*$ is a closure operator on classes of reduced $\mathbf{F}$ -matrix families and, moreover, given any such class $\mathbf{M}$, applying the operator to the class results in the smallest class of reduced $\mathbf{F}$ -matrix systems that contains $\mathbf{M}$ and is closed under the operations $\mathbf{M}$, $\overleftarrow{\mathbf{M}}$.

Theorem 1836 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a collection of reduced $\mathbf{F}$ -matrix families.*

- (a) $\mathbf{M}\overleftarrow{\mathbf{M}}^* : \mathcal{P}(\mathbf{MatFam}^*(\mathbf{F})) \rightarrow \mathcal{P}(\mathbf{MatFam}^*(\mathbf{F}))$ is a closure operator;
- (b) $\mathbf{M}\overleftarrow{\mathbf{M}}^*(\mathbf{M})$ is the smallest class of $\mathbf{F}$ -matrix families containing $\mathbf{M}$ and closed under the operators $\mathbf{M}$ and $\overleftarrow{\mathbf{M}}$.

Proof:

- (a) Inflationarity and monotonicity follow from the corresponding properties of the operators $\mathbb{M}$ and $\mathbb{III}$, which were established in Lemmas 1818 and 1819. For idempotency, we have

$$\begin{aligned}
 \mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M})) &= \mathbb{M}\mathbb{III}^{\leftarrow*}(\text{MatFam}^*(\mathcal{I}^{\mathbb{M}})) \\
 &\quad (\text{by Theorem 1835}) \\
 &\subseteq \text{MatFam}^*(\mathcal{I}^{\mathbb{M}}) \\
 &\quad (\text{by Corollary 1833}) \\
 &= \mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M}). \\
 &\quad (\text{again by Theorem 1835})
 \end{aligned}$$

- (b) By Part (a), $\mathbb{M} \subseteq \mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M})$. Moreover, if $\mathbb{O} \in \{\mathbb{M}, \mathbb{III}^{\leftarrow*}\}$, then

$$\begin{aligned}
 \mathbb{O}(\mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M})) &= \mathbb{O}(\text{MatFam}^*(\mathcal{I}^{\mathbb{M}})) \quad (\text{by Theorem 1835}) \\
 &\subseteq \text{MatFam}^*(\mathcal{I}^{\mathbb{M}}) \quad (\text{by Corollary 1833}) \\
 &= \mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M}). \quad (\text{by Theorem 1835})
 \end{aligned}$$

Hence, $\mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M})$ is closed under both operators. If $\mathbb{N}$ is a class of reduced $\mathbf{F}$ -matrix families such that $\mathbb{M} \subseteq \mathbb{N}$ and $\mathbb{N}$ closed under both operators, then, clearly, $\mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M}) \subseteq \mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{N}) = \mathbb{N}$. Therefore, $\mathbb{M}\mathbb{III}^{\leftarrow*}(\mathbb{M})$ is the smallest class satisfying these properties. ■

24.4 Protoclasses of Matrix Families

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. A class of $\mathbf{F}$ -matrix families $\mathbb{M}$ is called a **protoclass** if it is the class of all reduced $\mathcal{I}$ -matrix families for a protoalgebraic π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$ based on $\mathbf{F}$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{A}^i = \langle \mathbf{A}^i, \langle F^i, \alpha^i \rangle \rangle$, $i \in I$, a collection of $\mathbf{F}$ -algebraic systems and $\mathfrak{A}^i = \langle \mathcal{A}^i, T^i \rangle$ a collection of $\mathbf{F}$ -matrix families. We say that an $\mathbf{F}$ -matrix family $\mathfrak{A} = \langle \mathcal{A}, T \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, is a **subdirect intersection** of the collection $\mathfrak{A}^i$, $i \in I$, if there exist surjective morphisms

$$\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^i, \quad i \in I,$$

such that:

- $T = \bigcap_{i \in I} (\gamma^i)^{-1}(T^i)$;
- $\bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle) = \Delta^{\mathcal{A}}$.

Let $\mathbf{M}$ be a class of $\mathbf{F}$ -matrix families. Given an $\mathbf{F}$ -matrix family $\mathfrak{A}$, we write $\mathfrak{A} \in \overset{\triangleleft}{\Pi}(\mathbf{M})$ to denote the fact that $\mathfrak{A}$ is a subdirect intersection of members of $\mathbf{M}$.

It is not difficult to see that $\overset{\triangleleft}{\Pi}$ is a closure operator on classes of $\mathbf{F}$ -matrix families.

Lemma 1837 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. Then*

$$\overset{\triangleleft}{\Pi} : \mathcal{P}(\text{MatFam}(\mathbf{F})) \rightarrow \mathcal{P}(\text{MatFam}(\mathbf{F}))$$

is a closure operator on $\text{MatFam}(\mathbf{F})$.

Proof: Assume, first, that $\mathbf{M} \subseteq \text{MatFam}(\mathbf{F})$ and $\mathfrak{A} \in \mathbf{M}$. Then $\langle I, \iota \rangle : \mathfrak{A} \rightarrow \mathfrak{A}$ is a subdirect intersection morphism and, therefore, since $\mathfrak{A} \in \mathbf{M}$, we get $\mathfrak{A} \in \overset{\triangleleft}{\Pi}(\mathbf{M})$. Therefore $\overset{\triangleleft}{\Pi}$ is inflationary.

Suppose, next, that $\mathbf{M} \subseteq \mathbf{N} \subseteq \text{MatFam}(\mathbf{F})$. Let $\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^i$, $i \in I$, be a collection of subdirect intersection morphisms, with $\mathfrak{A}^i \in \mathbf{M}$, for all $i \in I$. Since, then, $\mathfrak{A}^i \in \mathbf{N}$, for all $i \in I$, the same collection of morphisms witnesses that $\mathfrak{A} \in \overset{\triangleleft}{\Pi}(\mathbf{N})$. Therefore, $\overset{\triangleleft}{\Pi}$ is also monotone.

Finally, assume that $\mathfrak{A} \in \overset{\triangleleft}{\Pi}(\overset{\triangleleft}{\Pi}(\mathbf{M}))$, where $\mathbf{M} \subseteq \text{MatFam}(\mathbf{F})$. Thus, there exists a collection of subdirect intersection morphisms

$$\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^i, \quad i \in I,$$

where $\mathfrak{A}^i \in \overset{\triangleleft}{\Pi}(\mathbf{M})$, for all $i \in I$. It now follows that, for each $i \in I$, there exists a collection of subdirect intersection morphisms

$$\langle H^{ij}, \gamma^{ij} \rangle : \mathfrak{A}^i \rightarrow \mathfrak{A}^{ij}, \quad j \in J_i,$$

where $\mathfrak{A}^{ij} \in \mathbf{M}$, for all $i \in I$ and all $j \in J_i$. We look at the collection

$$\langle H^{ij}, \gamma^{ij} \rangle \circ \langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^{ij}, \quad i \in I, j \in J_i,$$

with $\mathfrak{A}^{ij} \in \mathbf{M}$, for all $i \in I, j \in J_i$. We have

- For filter family intersections,

$$\begin{aligned} \bigcap_{i \in I} \bigcap_{j \in J_i} (\gamma^i)^{-1}((\gamma^{ij})^{-1}(T^{ij})) &= \bigcap_{i \in I} (\gamma^i)^{-1}(\bigcap_{j \in J_i} (\gamma^{ij})^{-1}(T^{ij})) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(T^i) \\ &= T. \end{aligned}$$

- Similarly, for kernels,

$$\begin{aligned} \bigcap_{i \in I} \bigcap_{j \in J_i} \text{Ker}(\langle H^{ij}, \gamma^{ij} \rangle \circ \langle H^i, \gamma^i \rangle) &= \bigcap_{i \in I} \bigcap_{j \in J_i} (\gamma^i)^{-1}((\gamma^{ij})^{-1}(\Delta^{\mathcal{A}^{ij}})) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\bigcap_{j \in J_i} \text{Ker}(\langle H^{ij}, \gamma^{ij} \rangle)) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\Delta^{\mathcal{A}^i}) \\ &= \bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle) \\ &= \Delta^{\mathcal{A}}. \end{aligned}$$

Therefore, $\langle H^{ij}, \gamma^{ij} \rangle \circ \langle H^i, \gamma^i \rangle$, $i \in I$, $j \in J_i$, is also a collection of subdirect intersection morphisms, and, hence $\mathfrak{A} \in \overset{\triangleleft}{\Pi}(\mathbf{M})$. We conclude that $\overset{\triangleleft}{\Pi}$ is also idempotent. ■

In general, given a class $\mathbf{M}$ of reduced $\mathbf{F}$ -matrix families, its closures under both operators Π and $\mathbf{M}^{-1*}$ are included in its closure under $\overset{\triangleleft}{\Pi}$.

Proposition 1838 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M}$ a class of reduced $\mathbf{F}$ -matrix families. Then*

$$\Pi(\mathbf{M}) \subseteq \overset{\triangleleft}{\Pi}(\mathbf{M}) \quad \text{and} \quad \mathbf{M}^{-1*}(\mathbf{M}) \subseteq \overset{\triangleleft}{\Pi}(\mathbf{M}).$$

Proof: Assume, first, that $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \Pi(\mathbf{M})$. Thus, there exists a collection $\mathfrak{A}^i = \langle \mathcal{A}, T^i \rangle \in \mathbf{M}$, such that

$$T = \bigcap_{i \in I} T^i.$$

Consider the family of surjective morphisms

$$\langle I, \iota \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{A}, T^i \rangle, \quad i \in I.$$

We have

- $T = \bigcap_{i \in I} T^i = \bigcap_{i \in I} \iota^{-1}(T^i)$, by hypothesis;
- $\bigcap_{i \in I} \text{Ker}(\langle I, \iota \rangle) = \bigcap_{i \in I} \Delta^{\mathcal{A}} = \Delta^{\mathcal{A}}$.

Therefore, since $\mathfrak{A}^i \in \mathbf{M}$, for all $i \in I$, $\mathfrak{A} \in \overset{\triangleleft}{\Pi}(\mathbf{M})$.

Assume, next, that $\mathfrak{A}^* = \langle \mathcal{A}/\Omega^{\mathcal{A}}(T), T/\Omega^{\mathcal{A}}(T) \rangle \in \mathbf{M}^{-1*}(\mathbf{M})$, where $\langle H, \gamma \rangle : \mathfrak{A} \rightarrow \mathfrak{A}'$ is a strict surjective morphism, with $\mathfrak{A}' = \langle \mathcal{A}', T' \rangle \in \mathbf{M}$. Since $\mathbf{M} \subseteq \text{MatFam}^*(\mathbf{F})$, there exists a factorization

$$\begin{array}{ccc} \mathfrak{A} & \xrightarrow{\langle H, \gamma \rangle} & \mathfrak{A}' \\ & \searrow \langle I, \pi \rangle & \swarrow \langle H, \gamma^* \rangle \\ & \mathfrak{A}^* & \end{array}$$

Moreover, we have

- $\pi^{-1}(\gamma^{*-1}(T')) = \gamma^{-1}(T') = T$, whence $\gamma^{*-1}(T') = T/\Omega^{\mathcal{A}}(T)$;
- $\text{Ker}(\langle H, \gamma^* \rangle) = \Delta^{\mathcal{A}^*}$ holds, since, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\begin{aligned} \langle \phi, \psi \rangle \in \text{Ker}_{\Sigma}(\langle H, \gamma^* \rangle) & \text{ iff } \gamma_{\Sigma}^*(\phi/\Omega_{\Sigma}^{\mathcal{A}}(T)) = \gamma_{\Sigma}^*(\psi/\Omega_{\Sigma}^{\mathcal{A}}(T)) \\ & \text{ iff } \gamma_{\Sigma}(\phi) = \gamma_{\Sigma}(\psi) \\ & \text{ iff } \langle \phi, \psi \rangle \in \gamma_{\Sigma}^{-1}(\Omega_{H(\Sigma)}^{\mathcal{A}'}(T')) \\ & \text{ iff } \langle \phi, \psi \rangle \in \Omega_{\Sigma}^{\mathcal{A}}(\gamma^{-1}(T')) \\ & \text{ iff } \langle \phi, \psi \rangle \in \Omega_{\Sigma}^{\mathcal{A}}(T). \end{aligned}$$

Therefore, $\mathfrak{A}^* \in \overset{\triangleleft}{\Pi}(\mathbf{M})$. ■

Another useful feature of the operator $\overset{\triangleleft}{\Pi}$ is that among model classes of matrix families, it characterizes those that are protoclasses.

Theorem 1839 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M} = \text{MatFam}^*(\mathcal{I})$ a class of reduced $\mathbf{F}$ -matrix families. Then $\mathbf{M}$ is a protoclass if and only if $\overset{\triangleleft}{\Pi}(\mathbf{M}) \subseteq \mathbf{M}$.*

Proof: Suppose, first, that $\mathbf{M} = \text{MatFam}^*(\mathcal{I})$, with $\mathcal{I}$ protoalgebraic and let $\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^{r_i}$, $i \in I$, be a collection of subdirect intersection morphisms. Then, clearly,

$$\begin{aligned} \mathfrak{A} &\in \overset{\triangleleft}{\Pi}\mathbf{M}^{-1}(\mathbf{M}) \quad (\text{Definition of } \overset{\triangleleft}{\Pi}) \\ &\subseteq \overset{\triangleleft}{\Pi}\mathbf{M}^{-1}(\text{MatFam}^*(\mathcal{I})) \quad (\text{Lemmas 1818 and 1819}) \\ &\subseteq \text{MatFam}(\mathcal{I}). \quad (\text{Proposition 1820}) \end{aligned}$$

It suffices now to show that $\mathcal{A}$ is reduced. We have

$$\begin{aligned} \Omega^{\mathcal{A}}(T) &= \Omega^{\mathcal{A}}(\bigcap_{i \in I} (\gamma^i)^{-1}(T^{r_i})) \quad (\text{Subdirect Intersection}) \\ &= \bigcap_{i \in I} \Omega^{\mathcal{A}}((\gamma^i)^{-1}(T^{r_i})) \quad (\mathcal{I} \text{ protoalgebraic}) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\Omega^{\mathcal{A}^{r_i}}(T^{r_i})) \quad (\langle H^i, \gamma^i \rangle \text{ surjective}) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\Delta^{\mathcal{A}^{r_i}}) \quad (\mathfrak{A}^{r_i} \text{ reduced}) \\ &= \bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle) \\ &= \Delta^{\mathcal{A}}. \quad (\text{Subdirect Intersection}) \end{aligned}$$

Since $\mathfrak{A} \in \text{MatFam}(\mathcal{I})$ and $\mathfrak{A}$ is reduced, we conclude that $\mathfrak{A} \in \text{MatFam}^*(\mathcal{I})$. So $\overset{\triangleleft}{\Pi}(\text{MatFam}^*(\mathcal{I})) \subseteq \text{MatFam}^*(\mathcal{I})$.

Suppose, conversely, that $\overset{\triangleleft}{\Pi}(\text{MatFam}^*(\mathcal{I})) \subseteq \text{MatFam}^*(\mathcal{I})$ and let $T, T' \in \text{ThFam}(\mathcal{I})$, with $T \leq T'$. We set

$$\mathfrak{F} := \langle \mathcal{F}/(\Omega(T) \cap \Omega(T')), (T \cap T')/(\Omega(T) \cap \Omega(T')) \rangle$$

and consider the surjective natural projection morphisms

$$\begin{aligned} \langle I, \pi \rangle : \mathfrak{F} &\rightarrow \langle \mathcal{F}/\Omega(T), T/\Omega(T) \rangle \\ \langle I, \pi' \rangle : \mathfrak{F} &\rightarrow \langle \mathcal{F}/\Omega(T'), T'/\Omega(T') \rangle. \end{aligned}$$

We observe that

- As far as filter families, we have

$$\begin{aligned} &(T \cap T')/(\Omega(T) \cap \Omega(T')) \\ &= T/(\Omega(T) \cap \Omega(T')) \cap T'/(\Omega(T) \cap \Omega(T')) \\ &= \pi^{-1}(T/\Omega(T')) \cap \pi'^{-1}(T'/\Omega(T')); \end{aligned}$$

- As far as kernels, we get

$$\begin{aligned} & \text{Ker}(\langle I, \pi \rangle) \cap \text{Ker}(\langle I, \pi' \rangle) \\ &= \Omega(T) / (\Omega(T) \cap \Omega(T')) \cap \Omega(T') / (\Omega(T) \cap \Omega(T')) \\ &= (\Omega(T) \cap \Omega(T')) / (\Omega(T) \cap \Omega(T')) = \Delta^{\mathfrak{F}}. \end{aligned}$$

Therefore,

$$\mathfrak{F} \in \overset{\triangleleft}{\text{III}}(\text{MatFam}^*(\mathcal{I})) \subseteq \text{MatFam}^*(\mathcal{I}).$$

Hence $\Omega(T) = \Omega(T \cap T') = \Omega(T) \cap \Omega(T')$, which implies that $\Omega(T) \leq \Omega(T')$. Thus, Ω is monotone on theory families and, hence, $\mathcal{I}$ is protoalgebraic. ■

Finally, we work to obtain expressions for the protoalgebraic $\text{MatFam}^*(\mathcal{I})$ based on a reduced class $\mathbf{M}$ of generating $\mathbf{F}$ -matrix families for $\mathcal{I}$.

We show, first, that if $\mathbf{M}$ is a class of reduced models of a protoalgebraic π -institution, then its closure under $\overset{\triangleleft}{\text{III}}$ is included in its closure under $\overset{\leftarrow}{\text{III}}^*$.

Proposition 1840 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a protoalgebraic π -institution based on $\mathbf{F}$ and $\mathbf{M} \subseteq \text{MatFam}^*(\mathcal{I})$ a class of reduced $\mathcal{I}$ -matrix families. Then*

$$\overset{\triangleleft}{\text{III}}(\mathbf{M}) \subseteq \overset{\leftarrow}{\text{III}}^*(\mathbf{M}).$$

Proof: Let $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \overset{\triangleleft}{\text{III}}(\mathbf{M})$. Then, there exists a collection of subdirect intersection morphisms

$$\langle H^i, \gamma^i \rangle : \langle \mathcal{A}, T \rangle \rightarrow \langle \mathcal{A}^i, T'^i \rangle, \quad i \in I,$$

where $\mathfrak{A}^i = \langle \mathcal{A}^i, T'^i \rangle \in \mathbf{M}$, for all $i \in I$. By using the same morphisms,

$$\langle H^i, \gamma^i \rangle : \langle \mathcal{A}, (\gamma^i)^{-1}(T'^i) \rangle \rightarrow \mathfrak{A}^i, \quad i \in I,$$

which have now become strict and surjective, we get that, for all $i \in I$, $\langle \mathcal{A}, (\gamma^i)^{-1}(T'^i) \rangle \in \mathbf{M}^{-1}(\mathbf{M})$. Moreover, since, by the definition of a subdirect intersection, $\mathfrak{A} = \langle \mathcal{A}, T \rangle = \langle \mathcal{A}, \bigcap_{i \in I} (\gamma^i)^{-1}(T'^i) \rangle$, we get that $\mathfrak{A} \in \overset{\triangleleft}{\text{III}}\mathbf{M}^{-1}(\mathbf{M})$. Now, by Theorem 1839, $\mathfrak{A}$ is reduced, whence $\mathfrak{A} \in (\overset{\triangleleft}{\text{III}}\mathbf{M}^{-1}(\mathbf{M}))^* = \overset{\leftarrow}{\text{III}}^*(\mathbf{M})$. ■

Next, it is shown that, if $\mathbf{M}$ is a class of reduced models of a protoalgebraic π -institution, then its closure under $\overset{\leftarrow}{\text{III}}^*$ is included in its closure under the operator $\overset{\triangleleft}{\text{III}}\mathbf{M}^{-1*}$.

Proposition 1841 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a protoalgebraic π -institution based on $\mathbf{F}$ and $\mathbf{M} \subseteq \text{MatFam}^*(\mathcal{I})$ a class of reduced $\mathcal{I}$ -matrix families. Then*

$$\overset{\leftarrow}{\text{III}}^*(\mathbf{M}) \subseteq \overset{\triangleleft}{\text{III}}\mathbf{M}^{-1*}(\mathbf{M}).$$

Proof: Suppose that $\mathbf{M} \subseteq \text{MatFam}^*(\mathcal{I})$, for a protoalgebraic π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$ and let $\mathfrak{A}^* = \langle \mathcal{A}/\Omega^{\mathcal{A}}(T), T/\Omega^{\mathcal{A}}(T) \rangle \in \overleftarrow{\text{III}}^*(\mathbf{M})$, where $\mathfrak{A} = \langle \mathcal{A}, T \rangle = \langle \mathcal{A}, \bigcap_{i \in I} T^i \rangle$ is such that there exist strict surjective morphisms

$$\langle H^i, \gamma^i \rangle : \langle \mathcal{A}, T^i \rangle \rightarrow \langle \mathcal{A}^i, T^i \rangle, \quad i \in I,$$

with $\mathfrak{A}^i = \langle \mathcal{A}^i, T^i \rangle \in \mathbf{M}$, for all $i \in I$. The key now is to look at the collection of the projection morphisms

$$\langle I, \pi^i \rangle : \mathfrak{A}^* \rightarrow \langle \mathcal{A}/\Omega^{\mathcal{A}}(T^i), T^i/\Omega^{\mathcal{A}}(T^i) \rangle, \quad i \in I,$$

where, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$,

$$\pi_{\Sigma}^i(\phi/\Omega_{\Sigma}^{\mathcal{A}}(\bigcap_{i \in I} T^i)) = \phi/\Omega_{\Sigma}^{\mathcal{A}}(T^i).$$

Since $\langle H^i, \gamma^i \rangle$ is strict and surjective, we have that $\langle \mathcal{A}, T^i \rangle \in \mathbf{M}^{-1}(\mathbf{M})$, for all $i \in I$. Thus, $\langle \mathcal{A}/\Omega^{\mathcal{A}}(T^i), T^i/\Omega^{\mathcal{A}}(T^i) \rangle \in \mathbf{M}^{-1*}(\mathbf{M})$. Therefore, to complete the proof, it suffices to show that the collection $\langle I, \pi^i \rangle$, $i \in I$, constitutes a collection of subdirect intersection morphisms. This is not difficult to verify. We have

- $\bigcap_{i \in I} (\pi^i)^{-1}(T^i/\Omega^{\mathcal{A}}(T^i)) = \bigcap_{i \in I} T^i/\Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i) = (\bigcap_{i \in I} T^i)/\Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i)$;
- For kernels,

$$\begin{aligned} \bigcap_{i \in I} \text{Ker}(\langle I, \pi^i \rangle) &= \bigcap_{i \in I} \Omega^{\mathcal{A}}(T^i)/\Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i) \\ &= \Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i)/\Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i) \quad (\mathcal{I} \text{ protoalgebraic}) \\ &= \Delta_{\mathcal{A}/\Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i)}. \end{aligned}$$

Now we have $\mathfrak{A}^* \in \overset{\triangleleft}{\text{III}}\mathbf{M}^{-1}(\mathbf{M})$. ■

We are now able to obtain, under protoalgebraicity, some equivalent expressions for the operator $\overleftarrow{\text{III}}^*$, which, based on Theorem 1835, will allow us to provide characterizations for the class $\text{MatFam}^*(\mathcal{I})$, in case $\mathcal{I}$ is protoalgebraic.

Theorem 1842 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{M} \subseteq \text{MatFam}^*(\mathcal{I})$, for a protoalgebraic π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$ based on $\mathbf{F}$. Then*

$$\overset{\triangleleft}{\text{III}}(\mathbf{M}) = \overleftarrow{\text{III}}^*(\mathbf{M}) = \overset{\triangleleft}{\text{III}}\mathbf{M}^{-1*}(\mathbf{M}).$$

Proof: Suppose $\mathbf{M} \subseteq \text{MatFam}^*(\mathcal{I})$, for a protoalgebraic π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$. Then, we have

$$\begin{aligned} \overset{\triangleleft}{\text{III}}(\mathbf{M}) &\subseteq \overleftarrow{\text{III}}^*(\mathbf{M}) \quad (\text{Proposition 1840}) \\ &\subseteq \overset{\triangleleft}{\text{III}}\mathbf{M}^{-1*}(\mathbf{M}) \quad (\text{Proposition 1841}) \\ &\subseteq \overset{\triangleleft}{\text{III}}(\overset{\triangleleft}{\text{III}}(\mathbf{M})) \quad (\text{Proposition 1838}) \\ &= \overset{\triangleleft}{\text{III}}(\mathbf{M}). \quad (\text{Lemma 1837}) \end{aligned}$$

The conclusion follows. ■

Finally, we get the following characterization of $\text{MatFam}^*(\mathcal{I}^M)$ in terms of closure operators on M , under the hypothesis that M is a subclass of a protoclass of $\mathbf{F}$ -matrix families.

Theorem 1843 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $M \subseteq \text{MatFam}^*(\mathcal{I})$, for a protoalgebraic π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$ based on $\mathbf{F}$. Then*

$$\text{MatFam}^*(\mathcal{I}^M) = \text{MIII}^{\triangleleft}(M).$$

Proof: Suppose $M \subseteq \text{MatFam}^*(\mathcal{I})$, for a protoalgebraic π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$. Then,

$$\begin{aligned} \text{MatFam}^*(\mathcal{I}^M) &= \text{MIII}^{\leftarrow*}(M) \quad (\text{Theorem 1835}) \\ &= \text{MIII}^{\triangleleft}(M). \quad (\text{Theorem 1842}) \end{aligned}$$
■

24.5 Irreducibility

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$, an $\mathbf{F}$ -algebraic system and $\mathfrak{A} = \langle \mathcal{A}, X \rangle \in \text{MatFam}(\mathcal{I})$.

An $\mathcal{I}$ -filter family $T \in \text{FiFam}^{\mathcal{I}}(\mathfrak{A})$ is **completely meet irreducible in** $\text{FiFam}^{\mathcal{I}}(\mathfrak{A})$ if, for all $\{T^i : i \in I\} \subseteq \text{FiFam}^{\mathcal{I}}(\mathfrak{A})$,

$$T = \bigcap_{i \in I} T^i \quad \text{implies} \quad T = T^i, \text{ for some } i \in I.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{A}^i = \langle \mathbf{A}^i, \langle F^i, \alpha^i \rangle \rangle$, $i \in I$, a collection of $\mathbf{F}$ -algebraic systems and $\mathfrak{A}^i = \langle \mathcal{A}^i, T^i \rangle$ a collection of $\mathbf{F}$ -matrix families. Recall that an $\mathbf{F}$ -matrix family $\mathfrak{A} = \langle \mathcal{A}, T \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, is a **subdirect intersection** of the collection $\mathfrak{A}^i$, $i \in I$, if there exist surjective morphisms

$$\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^i, \quad i \in I,$$

such that $T = \bigcap_{i \in I} (\gamma^i)^{-1}(T^i)$ and $\bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle) = \Delta^{\mathcal{A}}$. This subdirect intersection is called a **special subdirect intersection** if $H^i : \mathbf{Sign} \rightarrow \mathbf{Sign}^i$ is an isomorphism, for all $i \in I$.

It turns out that $\mathbf{F}$ -matrix families are representable as subdirect intersections if and only they are representable as special subdirect intersections.

Proposition 1844 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \mathbf{SEN}, N \rangle$, an $\mathbf{F}$ -algebraic system and $\mathfrak{A} = \langle \mathcal{A}, T \rangle$ an $\mathbf{F}$ -matrix family. Then $\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^i$, $i \in I$, is a collection of subdirect intersection morphisms if and only if*

$$\langle I, \pi^i \rangle : \mathfrak{A} \rightarrow \langle \mathcal{A}/\text{Ker}(\langle H^i, \gamma^i \rangle), (\gamma^i)^{-1}(T^i)/\text{Ker}(\langle H^i, \gamma^i \rangle) \rangle, \quad i \in I,$$

is a collection of special subdirect intersection morphisms.

Proof: Suppose, first, that $\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^i$, $i \in I$, is a subdirect intersection representation of $\mathfrak{A}$. For convenience, denote $\theta^i = \text{Ker}(\langle H^i, \gamma^i \rangle)$, $i \in I$. Note that there exist algebraic system morphisms $\langle H^i, \hat{\gamma}^i \rangle : \mathcal{A}^{\theta^i} \rightarrow \mathcal{A}^i$, such that

$$\begin{array}{ccc} \mathcal{A} & \xrightarrow{\langle H^i, \gamma^i \rangle} & \mathcal{A}^i \\ & \searrow \langle I, \pi^i \rangle & \nearrow \langle H^i, \hat{\gamma}^i \rangle \\ & \mathcal{A}^{\theta^i} & \end{array}$$

$$\langle H^i, \gamma^i \rangle = \langle H^i, \hat{\gamma}^i \rangle \circ \langle I, \pi^i \rangle,$$

where $\langle I, \pi^i \rangle : \mathcal{A} \rightarrow \mathcal{A}^{\theta^i}$, $i \in I$, are the quotient morphisms. Moreover, these morphisms are well-defined $\mathbf{F}$ -matrix family morphisms, since, for all $i \in I$, we have, on the one hand, $T \leq (\gamma^i)^{-1}(T^i) = (\pi^i)^{-1}((\gamma^i)^{-1}(T^i)/\theta^i)$, and, on the other, $(\pi^i)^{-1}((\gamma^i)^{-1}(T^i)/\theta^i) = (\hat{\gamma}^i)^{-1}(T^i) = (\pi^i)^{-1}((\hat{\gamma}^i)^{-1}(T^i))$ and, hence, by the surjectivity of $\langle I, \pi^i \rangle$, $(\gamma^i)^{-1}(T^i)/\theta^i = (\hat{\gamma}^i)^{-1}(T^i)$. Now we compute:

- For the filter families:

$$\begin{aligned} & \bigcap_{i \in I} (\pi^i)^{-1}((\gamma^i)^{-1}(T^i)/\theta^i) \\ &= \bigcap_{i \in I} (\pi^i)^{-1}(\pi^i((\gamma^i)^{-1}(T^i))) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(T^i) \\ & \quad (\theta^i \text{ compatible with } (\gamma^i)^{-1}(T^i)) \\ &= T. \quad (\text{by hypothesis}) \end{aligned}$$

- For the kernels

$$\begin{aligned} \bigcap_{i \in I} \text{Ker}(\langle I, \pi^i \rangle) &= \bigcap_{i \in I} \theta^i \\ &= \Delta^{\mathcal{A}}. \quad (\text{by hypothesis}) \end{aligned}$$

Therefore,

$$\langle I, \pi^i \rangle : \mathfrak{A} \rightarrow \langle \mathcal{A}/\text{Ker}(\langle H^i, \gamma^i \rangle), (\gamma^i)^{-1}(T^i)/\text{Ker}(\langle H^i, \gamma^i \rangle) \rangle, \quad i \in I,$$

is a collection of special subdirect intersection morphisms. ■

Special subdirect intersections of reduced matrix families have a characterization similar to the one applicable for subdirect products of reduced matrixed.

Proposition 1845 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle$ be an $\mathbf{F}$ -algebraic system and $\mathfrak{A} = \langle \mathcal{A}, T \rangle$ an $\mathbf{F}$ -matrix family. $\mathfrak{A}$ is a special subdirect intersection of the system $\{\mathfrak{A}^i = \langle \mathcal{A}^i, T^i \rangle : i \in I\}$ of reduced $\mathbf{F}$ -matrix families if and only if, there exists a corresponding system of sentence families $\{T^i : i \in I\} \subseteq \text{SenFam}(\mathcal{A})$, such that:*

- (i) $\bigcap_{i \in I} T^i = T$;
- (ii) $\mathfrak{A}/T^i \cong \mathfrak{A}^i$, for all $i \in I$.

Proof: Suppose, first, that $\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^i$, $i \in I$, is a collection of special subdirect intersection morphisms. Define $T^i = (\gamma^i)^{-1}(T^i)$, $i \in I$. Then, we have

- $\bigcap_{i \in I} T^i = \bigcap_{i \in I} (\gamma^i)^{-1}(T^i) = T$;
- Noting that

$$\begin{aligned} \Omega^{\mathcal{A}}(T^i) &= \Omega^{\mathcal{A}}((\gamma^i)^{-1}(T^i)) \quad (\text{definition of } T^i) \\ &= (\gamma^i)^{-1}(\Omega^{\mathcal{A}^i}(T^i)) \quad (\text{Proposition 24}) \\ &= (\gamma^i)^{-1}(\Delta^{\mathcal{A}^i}) \quad (\mathfrak{A}^i \text{ reduced}) \\ &= \text{Ker}(\langle H^i, \gamma^i \rangle), \quad (\text{set theory}) \end{aligned}$$

we obtain

$$\begin{aligned} \mathfrak{A}/T^i &= \langle \mathcal{A}/\Omega^{\mathcal{A}}(T^i), T^i/\Omega^{\mathcal{A}}(T^i) \rangle \\ &= \langle \mathcal{A}/\text{Ker}(\langle H^i, \gamma^i \rangle), (\gamma^i)^{-1}(T^i)/\text{Ker}(\langle H^i, \gamma^i \rangle) \rangle \\ &\cong \mathfrak{A}^i, \end{aligned}$$

where the last isomorphism is established by the morphism $\langle H^i, \hat{\gamma}^i \rangle : \mathcal{A}/\text{Ker}(\langle H^i, \gamma^i \rangle) \rightarrow \mathcal{A}^i$, given in Proposition 1844.

Thus, (i) and (ii) of the statement hold.

Assume, conversely, that there exists a system $\{T^i : i \in I\} \subseteq \text{SenFam}(\mathcal{A})$ satisfying (i) and (ii). Consider $\langle I, \pi^i \rangle : \mathcal{A} \rightarrow \mathcal{A}/\Omega^{\mathcal{A}}(T^i)$, $i \in I$. This forms a well-defined system of $\mathbf{F}$ -matrix family morphisms

$$\langle I, \pi^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}/T^i, \quad i \in I.$$

Since, by hypothesis, $\mathfrak{A}/T^i \cong \mathfrak{A}^i$, for all $i \in I$, it suffices to show that the above system of morphisms constitutes a subdirect intersection. We indeed have

- $\bigcap_{i \in I} (\pi^i)^{-1}(T^i/\Omega^{\mathcal{A}}(T^i)) = \bigcap_{i \in I} T^i = T$;
- $\bigcap_{i \in I} \text{Ker}(\langle I, \pi^i \rangle) = \bigcap_{i \in I} \Omega^{\mathcal{A}}(T^i) \leq \Omega^{\mathcal{A}}(\bigcap_{i \in I} T^i) = \Omega^{\mathcal{A}}(T) = \Delta^{\mathcal{A}}$.

So $\{\langle I, \pi^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}/T^i : i \in I\}$ is a system of special subdirect intersection morphisms. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathbf{M}$ a class of reduced $\mathbf{F}$ -matrix families and $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \mathbf{M}$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$.

The $\mathbf{F}$ -matrix family $\mathfrak{A} \in \mathbf{M}$ is called **subdirectly irreducible relative to $\mathbf{M}$** if, for every subdirect intersection

$$\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^{n_i}, \quad i \in I,$$

with $\mathfrak{A}^{n_i} \in \mathbf{M}$, for all $i \in I$, there exists $i \in I$, such that

$$(i) \quad T = (\gamma^i)^{-1}(T^{n_i}) \text{ and}$$

$$(ii) \quad \text{Ker}(\langle H^i, \gamma^i \rangle) = \Delta^{\mathcal{A}}.$$

We write $\mathbf{M}^s$ for the class of all relatively subdirectly irreducible members of $\mathbf{M}$.

If $\mathcal{I} = \langle \mathbf{F}, C \rangle$ is a π -institution based on $\mathbf{F}$ and $\mathbf{M} = \text{MatFam}^*(\mathcal{I})$ is the class of all reduced $\mathcal{I}$ -matrix families, then a subdirectly irreducible $\mathfrak{A}$ relative to $\mathbf{M}$ is also called **subdirectly irreducible relative to $\mathcal{I}$** .

It turns out that relative subdirect irreducibility and complete meet irreducibility have a close relationship. To detail the relationship, we need an additional operator on classes of $\mathbf{F}$ -matrix families.

Proposition 1846 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, \mathbf{IN}^b \rangle$ be an algebraic system and $\mathbf{M}$ a class of reduced $\mathbf{F}$ -matrix families closed under reduced inverse morphic images, i.e., such that $\mathbf{M}^{-1*}(\mathbf{M}) \subseteq \mathbf{M}$. Then an $\mathbf{F}$ -matrix family $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \mathbf{M}$ is subdirectly irreducible relative to $\mathbf{M}$ if and only if T is completely meet irreducible in $\mathcal{X} = \{X \in \text{SenFam}(\mathcal{A}) : \mathfrak{A}/X \in \mathbf{M}\}$.*

Proof: Suppose, first, that $\mathfrak{A} = \langle \mathcal{A}, T \rangle \in \mathbf{M}^s$ and let $\{X^i : i \in I\} \subseteq \mathcal{X}$, such that $T = \bigcap_{i \in I} X^i$. Then, by Proposition 1844,

$$\langle I, \pi^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}/X^i, \quad i \in I,$$

constitutes a special subdirect intersection. Moreover, since $X^i \in \mathcal{X}$, for all $i \in I$, we have that $\mathfrak{A}/X^i \in \mathbf{M}$, for all $i \in I$. By hypothesis, there exists an $i \in I$, such that $T = (\pi^i)^{-1}(X^i/\Omega^{\mathcal{A}}(X^i)) = X^i$. We conclude that T is completely meet irreducible in $\mathcal{X}$.

Assume, conversely, that T is completely meet irreducible in $\mathcal{X}$ and let

$$\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}^{n_i}, \quad i \in I,$$

be a system of subdirect intersection morphisms, with $\mathfrak{A}^{n_i} \in \mathbf{M}$, for all $i \in I$. By Proposition 1844,

$$\langle I, \pi^i \rangle : \mathfrak{A} \rightarrow \mathfrak{A}/(\gamma^i)^{-1}(T^{n_i}), \quad i \in I,$$

is a collection of special subdirect intersection morphisms. Moreover, $\langle H^i, \hat{\gamma}^i \rangle : \mathfrak{A}/(\gamma^i)^{-1}(T'^i) \rightarrow \mathfrak{A}'^i$, $i \in I$, are strict surjective morphisms and $\mathfrak{A}/(\gamma^i)^{-1}(T'^i)$ is reduced. Thus, since $\mathfrak{A}'^i \in \mathbf{M}$, for all $i \in I$ and $\mathbf{M}^{-1*}(\mathbf{M}) \subseteq \mathbf{M}$, we get that $\mathfrak{A}/(\gamma^i)^{-1}(T'^i) \in \mathbf{M}$, for all $i \in I$. This shows that $(\gamma^i)^{-1}(T'^i) \in \mathcal{X}$, for all $i \in I$. But, by the subdirect intersection property, $T = \bigcap_{i \in I} (\gamma^i)^{-1}(T'^i)$, whence, by hypothesis, there exists $i \in I$, such that $T = (\gamma^i)^{-1}(T'^i)$. Moreover, $\text{Ker}(\langle H^i, \hat{\gamma}^i \rangle) = (\gamma^i)^{-1}(\Delta^{\mathcal{A}'^i}) = (\gamma^i)^{-1}(\Omega^{\mathcal{A}'^i}(T'^i)) = \Omega^{\mathcal{A}}((\gamma^i)^{-1}(T'^i)) = \Omega^{\mathcal{A}}(T) = \Delta^{\mathcal{A}}$. Therefore, $\mathfrak{A}$ is subdirectly irreducible relative to $\mathbf{M}$. ■

Chapter 25

Order Algebraizability

25.1 Algebraic PoSystems

Let $\mathbf{Sign}$ be a category and $\text{SEN} : \mathbf{Sign} \rightarrow \mathbf{Set}$ be a sentence functor. A **qofamily** $\leq = \{\leq_\Sigma\}_{\Sigma \in |\mathbf{Sign}|}$ on SEN is a relation family on SEN , such that, for all $\Sigma \in |\mathbf{Sign}|$, $\leq_\Sigma \subseteq \text{SEN}(\Sigma)^2$ is a quasi-order on $\text{SEN}(\Sigma)$. A **pofamily** $\leq = \{\leq_\Sigma\}_{\Sigma \in |\mathbf{Sign}|}$ on SEN is a relation family on SEN , such that, for all $\Sigma \in |\mathbf{Sign}|$, $\leq_\Sigma \subseteq \text{SEN}(\Sigma)^2$ is a partial order on $\text{SEN}(\Sigma)$. A **qosystem** $\leq$ on SEN is a qofamily that is also a relation system. i.e., invariant under $\mathbf{Sign}$ -morphisms, that is, such that, for all $\Sigma, \Sigma' \in |\mathbf{Sign}|$ and all $f \in \mathbf{Sign}(\Sigma, \Sigma')$,

$$\text{SEN}(f)(\leq_\Sigma) \subseteq \leq_{\Sigma'}.$$

Similarly, a **posystem** $\leq$ on SEN is a pofamily that is also a relation system.

Let $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$ be an algebraic system. A **qosystem** (**posystem**) on $\mathbf{A}$ is a qosystem (posystem, respectively) on SEN . The pair $\langle \mathbf{A}, \leq \rangle$ is then called an **algebraic qosystem** (**algebraic posystem**, respectively).

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system. A **qosystem** (**posystem**) on $\mathcal{A}$ is a qosystem (posystem, respectively) on $\mathbf{A}$. We then term the pair $\langle \mathcal{A}, \leq \rangle$ an **F-algebraic qosystem** (**F-algebraic posystem**, respectively).

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system.

- The family of **F-inequations** $\text{In}(\mathbf{F}) = \{\text{In}_\Sigma(\mathbf{F})\}_{\Sigma \in |\mathbf{Sign}^b|}$ is defined by setting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\text{In}_\Sigma(\mathbf{F}) = \{\phi \leq \psi : \phi, \psi \in \text{SEN}^b(\Sigma)\};$$

- The family of **F-quasi inequations** $\text{QIn}(\mathbf{F}) = \{\text{QIn}_\Sigma(\mathbf{F})\}_{\Sigma \in |\mathbf{Sign}^b|}$ is defined by setting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\text{QIn}_\Sigma(\mathbf{F}) = \{\{\phi_i \leq \psi_i : i < k\}, \phi \leq \psi : \vec{\phi}, \vec{\psi}, \phi, \psi \in \text{SEN}^b(\Sigma)\};$$

- The family of **F-guasi inequations** $\text{GIn}(\mathbf{F}) = \{\text{GIn}_\Sigma(\mathbf{F})\}_{\Sigma \in |\mathbf{Sign}^b|}$ is defined by setting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\text{GIn}_\Sigma(\mathbf{F}) = \{\{\phi_i \leq \psi_i : i \in I\}, \phi \leq \psi : \vec{\phi}, \vec{\psi}, \phi, \psi \in \text{SEN}^b(\Sigma)\}.$$

As done previously, we sometimes abbreviate a guasi inequation $\langle \{\phi_i \leq \psi_i : i \in I\}, \phi \leq \psi \rangle$ by writing $\langle \vec{\phi} \leq \vec{\psi}, \phi \leq \psi \rangle$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. We define the family $C^{\mathbf{K}, \leq} : \mathcal{P}\text{In}(\mathbf{F}) \rightarrow \mathcal{P}\text{In}(\mathbf{F})$ by setting, for all $\Sigma \in |\mathbf{Sign}^b|$, $I \cup \{\phi \leq \psi\} \subseteq \text{In}_\Sigma(\mathbf{F})$,

$$\begin{aligned} \phi \leq \psi \in C_\Sigma^{\mathbf{K}, \leq}(I) \text{ iff, for all } \langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \in \mathbf{K}, \Sigma' \in |\mathbf{Sign}^b|, f \in \mathbf{Sign}^b(\Sigma, \Sigma'), \\ \alpha_{\Sigma'}(\text{SEN}^b(f)(I)) \subseteq \leq_{F(\Sigma')}^{\mathcal{A}} \\ \text{implies } \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \leq_{F(\Sigma')}^{\mathcal{A}} \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi)). \end{aligned}$$

It is not difficult to see that $C^{\mathbf{K}, \leq}$ is a closure system on $\text{In}(\mathbf{F})$.

Lemma 1847 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. Then $C^{\mathbf{K}, \leq} : \mathcal{P}\text{In}(\mathbf{F}) \rightarrow \mathcal{P}\text{In}(\mathbf{F})$ is a closure system on $\text{In}(\mathbf{F})$.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$. It is straightforward from the definition of $C^{\mathbf{K}, \leq}$ that $C^{\mathbf{K}, \leq}$ is inflationary and monotone. We show that it is also idempotent. To this end, let $I \cup \{\phi \leq \psi\} \subseteq \text{In}_\Sigma(\mathbf{F})$, be such that $\phi \leq \psi \in C^{\mathbf{K}, \leq}_\Sigma(C^{\mathbf{K}, \leq}_\Sigma(I))$. Then, for all $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \in \mathbf{K}$, all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, we have $\alpha_{\Sigma'}(\mathbf{SEN}^b(f)(I)) \subseteq \leq^{\mathcal{A}}_{F(\Sigma')}$ implies, by definition,

$$\alpha_{\Sigma'}(\mathbf{SEN}^b(f)(C^{\mathbf{K}, \leq}_\Sigma(I))) \subseteq \leq^{\mathcal{A}}_{F(\Sigma')},$$

whence, by the hypothesis and the definition,

$$\alpha_{\Sigma'}(\mathbf{SEN}^b(f)(\phi)) \leq^{\mathcal{A}}_{F(\Sigma')} \alpha_{\Sigma'}(\mathbf{SEN}^b(f)(\psi)).$$

We now get $\phi \leq \psi \in C^{\mathbf{K}, \leq}_\Sigma(I)$. Therefore, $C^{\mathbf{K}, \leq}_\Sigma$ is also idempotent.

Finally, it only remains to show structurality. To this end, let $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and $I \cup \{\phi \leq \psi\} \subseteq \text{In}_\Sigma(\mathbf{F})$, such that $\phi \leq \psi \in C^{\mathbf{K}, \leq}_\Sigma(I)$. Then, by definition, for every $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \in \mathbf{K}$, all $\Sigma'' \in |\mathbf{Sign}^b|$ and all $h \in \mathbf{Sign}^b(\Sigma, \Sigma'')$, $\alpha_{\Sigma''}(\mathbf{SEN}^b(h)(I)) \subseteq \leq^{\mathcal{A}}_{F(\Sigma')}$ implies $\alpha_{\Sigma''}(\mathbf{SEN}^b(h)(\phi)) \leq^{\mathcal{A}}_{F(\Sigma'')} \alpha_{\Sigma''}(\mathbf{SEN}^b(h)(\psi))$.

$$\begin{array}{ccc} \Sigma & \xrightarrow{f} & \Sigma' \\ & \searrow h \quad \swarrow g & \\ & \Sigma'' & \end{array}$$

In particular, for all $\Sigma'' \in |\mathbf{Sign}^b|$ and all $g \in \mathbf{Sign}^b(\Sigma', \Sigma'')$,

$$\alpha_{\Sigma''}(\mathbf{SEN}^b(g)(\mathbf{SEN}^b(f)(I))) \subseteq \leq^{\mathcal{A}}_{F(\Sigma'')}$$

implies

$$\alpha_{\Sigma''}(\mathbf{SEN}^b(g)(\mathbf{SEN}^b(f)(\phi))) \leq^{\mathcal{A}}_{F(\Sigma'')} \alpha_{\Sigma''}(\mathbf{SEN}^b(g)(\mathbf{SEN}^b(f)(\psi))).$$

Therefore, $\mathbf{SEN}^b(f)(\phi) \leq \mathbf{SEN}^b(f)(\psi) \in C^{\mathbf{K}, \leq}_{\Sigma'}(\mathbf{SEN}^b(f)(I))$. We conclude that $C^{\mathbf{K}, \leq}$ is also structural and, hence, a closure system on $\text{In}(\mathbf{F})$. ■

As a result of Lemma 1847, it makes sense to define the **inequational π -institution** $\mathcal{I}^{\mathbf{K}, \leq} = \langle \mathbf{F}, C^{\mathbf{K}, \leq} \rangle$ associated with a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems.

We can show that the π -institution $\mathcal{I}^{\mathbf{K}, \leq}$ associated with the class $\mathbf{K}$ satisfies a reflexivity and transitivity property. On the other hand, antisymmetry is not expressible in the language under consideration, since it is a language without equality.

Lemma 1848 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi \in \mathbf{SEN}^b(\Sigma)$,*

- (a) $\phi \leq \phi \in C_{\Sigma}^{\mathbf{K}, \leq}(\emptyset)$;
- (b) $\phi \leq \chi \in C_{\Sigma}^{\mathbf{K}, \leq}(\phi \leq \psi, \psi \leq \chi)$.

Proof: Clearly, for all $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \in \mathbf{K}$, all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, we get, by the reflexivity of $\leq^{\mathcal{A}}$, that

$$\mathbf{SEN}^b(f)(\phi) \leq_{F(\Sigma')}^{\mathcal{A}} \mathbf{SEN}^b(f)(\phi).$$

Thus, by definition, $\phi \leq \phi \in C_{\Sigma}^{\mathbf{K}, \leq}(\emptyset)$.

Similarly, for all $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \in \mathbf{K}$, all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, by the transitivity of $\leq^{\mathcal{A}}$, we get that

$$\mathbf{SEN}^b(f)(\phi) \leq_{F(\Sigma')}^{\mathcal{A}} \mathbf{SEN}^b(f)(\psi) \text{ and } \mathbf{SEN}^b(f)(\psi) \leq_{F(\Sigma')}^{\mathcal{A}} \mathbf{SEN}^b(f)(\chi)$$

imply $\mathbf{SEN}^b(f)(\phi) \leq_{F(\Sigma')}^{\mathcal{A}} \mathbf{SEN}^b(f)(\chi)$. Therefore, by definition $\phi \leq \chi \in C_{\Sigma}^{\mathbf{K}, \leq}(\phi \leq \psi, \psi \leq \chi)$. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$ an $\mathbf{F}$ -algebraic posystem and $g = \langle \vec{\phi} \leq \vec{\psi}, \phi \leq \psi \rangle \in \mathbf{GIn}_{\Sigma}(\mathbf{F})$. We say $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$ **satisfies** g or that g **holds** or **is valid in** $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$, written

$$\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \models_{\Sigma} g,$$

if, for all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\alpha_{\Sigma'}(\mathbf{SEN}^b(f)(\phi_i)) \leq_{F(\Sigma')}^{\mathcal{A}} \alpha_{\Sigma'}(\mathbf{SEN}^b(f)(\psi_i)), \text{ for all } i \in I,$$

imply $\alpha_{\Sigma'}(\mathbf{SEN}^b(f)(\phi)) \leq_{F(\Sigma')}^{\mathcal{A}} \alpha_{\Sigma'}(\mathbf{SEN}^b(f)(\psi))$. Equivalently, $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$ satisfies g if $\phi \leq \psi \in C_{\Sigma}^{\{\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle\}, \leq}(\vec{\phi} \leq \vec{\psi})$.

Given a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems and a class G of $\mathbf{F}$ -guasi inequations, we write $\mathbf{GIn}(\mathbf{K})$ for the class of all $\mathbf{F}$ -guasi inequations satisfied by every $\mathbf{F}$ -algebraic posystem in $\mathbf{K}$ and $\mathbf{PAlgSys}(G)$ for the class of all $\mathbf{F}$ -algebraic posystems that satisfy all $\mathbf{F}$ -guasi inequations in G .

We now turn to examining some operations on classes of $\mathbf{F}$ -algebraic posystems. We first show that the inverse image of a posystem under an $\mathbf{F}$ -algebraic system morphism is also a posystem.

Lemma 1849 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ be two $\mathbf{F}$ -algebraic systems and $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism.*

- (a) *If $\leq^{\mathcal{B}}$ is a posystem on $\mathcal{B}$, then $\gamma^{-1}(\leq^{\mathcal{B}})$ is a qosystem on $\mathcal{A}$;*

(b) If $\leq^{\mathcal{B}}$ is a posystem on $\mathcal{B}$ and $\text{Ker}(\langle H, \gamma \rangle) = \Delta^{\mathcal{A}}$, then $\gamma^{-1}(\leq^{\mathcal{B}})$ is a posystem on $\mathcal{A}$.

Proof: Let $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi, \chi \in \text{SEN}(\Sigma)$.

By the reflexivity of $\leq^{\mathcal{B}}$, we have $\gamma_{\Sigma}(\phi) \leq_{H(\Sigma)}^{\mathcal{B}} \gamma_{\Sigma}(\phi)$. Thus, $\phi \gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}}) \phi$ and, hence $\gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}})$ is reflexive.

Suppose, next, that $\phi \gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}}) \psi$ and $\psi \gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}}) \chi$. Then, $\gamma_{\Sigma}(\phi) \leq_{H(\Sigma)}^{\mathcal{B}} \gamma_{\Sigma}(\psi)$ and $\gamma_{\Sigma}(\psi) \leq_{H(\Sigma)}^{\mathcal{B}} \gamma_{\Sigma}(\chi)$. Thus, by the transitivity of $\leq^{\mathcal{B}}$, we get $\gamma_{\Sigma}(\phi) \leq_{H(\Sigma)}^{\mathcal{B}} \gamma_{\Sigma}(\chi)$. Therefore, $\phi \gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}}) \chi$ and $\gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}})$ is also transitive.

If $\phi \gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}}) \psi$, $\Sigma' \in |\mathbf{Sign}|$ and $f \in \mathbf{Sign}(\Sigma, \Sigma')$, then we get $\gamma_{\Sigma}(\phi) \leq_{H(\Sigma)}^{\mathcal{B}} \gamma_{\Sigma}(\psi)$, whence $\text{SEN}'(H(f))(\gamma_{\Sigma}(\phi)) \leq_{H(\Sigma')}^{\mathcal{B}} \text{SEN}'(H(f))(\gamma_{\Sigma}(\psi))$. Thus,

$$\gamma_{\Sigma'}(\text{SEN}(f)(\phi)) \leq_{H(\Sigma')}^{\mathcal{B}} \gamma_{\Sigma'}(\text{SEN}(f)(\psi)).$$

So we obtain $\text{SEN}(f)(\phi) \gamma_{\Sigma'}^{-1}(\leq^{\mathcal{B}}) \text{SEN}(f)(\psi)$. This shows that $\gamma^{-1}(\leq^{\mathcal{B}})$ is a posystem on $\mathcal{A}$.

Suppose, finally, for the sake of proving Part (b), that $\phi \gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}}) \psi$ and $\psi \gamma_{\Sigma}^{-1}(\leq^{\mathcal{B}}) \phi$. Then, $\gamma_{\Sigma}(\phi) \leq_{H(\Sigma)}^{\mathcal{B}} \gamma_{\Sigma}(\psi)$ and $\gamma_{\Sigma}(\psi) \leq_{H(\Sigma)}^{\mathcal{B}} \gamma_{\Sigma}(\phi)$. Thus, by the antisymmetry of $\leq^{\mathcal{B}}$, we get $\gamma_{\Sigma}(\phi) = \gamma_{\Sigma}(\psi)$. Since, by hypothesis, $\text{Ker}(\langle H, \gamma \rangle) = \Delta^{\mathcal{A}}$, we get $\phi = \psi$ and, hence, $\gamma^{-1}(\leq^{\mathcal{B}})$ is a posystem on $\mathcal{A}$ in this case. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems and $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, an $\mathbf{F}$ -algebraic posystem.

- Given $\Sigma \in |\mathbf{Sign}^b|$, we say that $\langle \mathcal{A}, \leq \rangle$ is Σ -**K-order certified** if there exists $\langle \mathcal{A}^{\Sigma}, \leq^{\Sigma} \rangle \in \mathbf{K}$, such that $\text{In}_{\Sigma}(\langle \mathcal{A}, \leq \rangle) = \text{In}_{\Sigma}(\langle \mathcal{A}^{\Sigma}, \leq^{\Sigma} \rangle)$. In this case $\langle \mathcal{A}^{\Sigma}, \leq^{\Sigma} \rangle$ will be referred to as the Σ -**K-order certificate** of $\langle \mathcal{A}, \leq \rangle$.
- We say that $\langle \mathcal{A}, \leq \rangle$ is **K-order certified** if it is Σ -K-order certified, for all $\Sigma \in |\mathbf{Sign}^b|$. This, of course, means that

$$(\forall \Sigma \in |\mathbf{Sign}^b|)(\exists \langle \mathcal{A}^{\Sigma}, \leq^{\Sigma} \rangle \in \mathbf{K})(\text{In}_{\Sigma}(\langle \mathcal{A}, \leq \rangle) = \text{In}_{\Sigma}(\langle \mathcal{A}^{\Sigma}, \leq^{\Sigma} \rangle)).$$

We write $\mathbf{C}(\mathbf{K})$ for the class of all $\mathbf{F}$ -algebraic posystems that are $\mathbf{K}$ -order certified. We say that $\mathbf{K}$ is an **abstract order class** whenever every $\mathbf{K}$ -order certified $\mathbf{F}$ -algebraic posystem belongs to $\mathbf{K}$, i.e., when $\mathbf{C}(\mathbf{K}) = \mathbf{K}$.

It is not difficult to show that $\mathbf{C}$ is a closure operator on classes of $\mathbf{F}$ -algebraic systems.

Proposition 1850 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system. Then the operator $\mathbf{C}$ on classes of $\mathbf{F}$ -algebraic posystems is a closure operator.*

Proof: Suppose $\mathbf{K}$ is a class of $\mathbf{F}$ -algebraic posystems.

- Let $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$. Then, since for all $\Sigma \in |\mathbf{Sign}^b|$, $\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle = \langle \mathcal{A}, \leq \rangle \in \mathbf{K}$ is a Σ - $\mathbf{K}$ -order certificate for $\langle \mathcal{A}, \leq \rangle$, we get that $\langle \mathcal{A}, \leq \rangle \in \mathbf{C}(\mathbf{K})$. Thus, $\mathbf{K} \subseteq \mathbf{C}(\mathbf{K})$ and $\mathbf{C}$ is inflationary.
- If $\mathbf{K} \subseteq \mathbf{K}'$ and $\langle \mathcal{A}, \leq \rangle \in \mathbf{C}(\mathbf{K})$, then, by definition, for every $\Sigma \in |\mathbf{Sign}^b|$, there exists a Σ - $\mathbf{K}$ -order certificate $\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle$. Since $\mathbf{K} \subseteq \mathbf{K}'$, $\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle \in \mathbf{K}'$ is also a Σ - $\mathbf{K}'$ -order certificate. Thus, $\langle \mathcal{A}, \leq \rangle \in \mathbf{C}(\mathbf{K}')$ and $\mathbf{C}$ is also monotone.
- Finally, suppose that $\langle \mathcal{A}, \leq \rangle \in \mathbf{C}(\mathbf{C}(\mathbf{K}))$. Then, there exists, for all $\Sigma \in |\mathbf{Sign}^b|$, a Σ - $\mathbf{C}(\mathbf{K})$ -order certificate $\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle$ for $\mathcal{A}$. Therefore, for every $\Sigma' \in |\mathbf{Sign}^b|$, there exists a Σ' - $\mathbf{K}$ -order certificate $\langle \mathcal{A}^{\langle \Sigma, \Sigma' \rangle}, \leq^{\langle \Sigma, \Sigma' \rangle} \rangle$ for $\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle$. Thus, for every $\Sigma \in |\mathbf{Sign}^b|$, there exists a Σ - $\mathbf{K}$ -order certificate $\langle \mathcal{A}^{\langle \Sigma, \Sigma \rangle}, \leq^{\langle \Sigma, \Sigma \rangle} \rangle$ for $\langle \mathcal{A}, \leq \rangle$, since, by hypothesis,

$$\text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) = \text{In}_\Sigma(\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle) = \text{In}_\Sigma(\langle \mathcal{A}^{\langle \Sigma, \Sigma \rangle}, \leq^{\langle \Sigma, \Sigma \rangle} \rangle).$$

Thus $\mathbf{C}$ is a closure operator on classes of $\mathbf{F}$ -algebraic posystems. $\blacksquare$

The importance of abstract classes of $\mathbf{F}$ -algebraic posystems rests on the fact that the validity of an $\mathbf{F}$ -guasi inequation transfers from $\mathbf{K}$ -order certificates to an $\mathbf{F}$ -algebraic posystem itself.

Lemma 1851 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems and $\langle \mathcal{A}, \leq \rangle$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, an $\mathbf{F}$ -algebraic posystem. If $\mathcal{A} \in \mathbf{C}(\mathbf{K})$, then $\text{GIn}(\mathbf{K}) \leq \text{GIn}(\mathcal{A})$.*

Proof: Suppose $\langle \mathcal{A}, \leq \rangle \in \mathbf{C}(\mathbf{K})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\langle \vec{\phi} \leq \vec{\psi}, \phi \leq \psi \rangle \in \text{GIn}_\Sigma(\mathbf{K})$, such that $\vec{\phi} \leq \vec{\psi} \subseteq \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle)$. Let $\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle \in \mathbf{K}$ be a Σ - $\mathbf{K}$ -order certificate for $\mathcal{A}$. Then, by definition $\vec{\phi} \leq \vec{\psi} \subseteq \text{In}_\Sigma(\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle)$. Since $\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle \in \mathbf{K}$ and $\langle \vec{\phi} \leq \vec{\psi}, \phi \leq \psi \rangle \in \text{GIn}_\Sigma(\mathbf{K})$, we get $\phi \leq \psi \in \text{In}_\Sigma(\langle \mathcal{A}^\Sigma, \leq^\Sigma \rangle) = \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle)$. Therefore, $\langle \vec{\phi} \leq \vec{\psi}, \phi \leq \psi \rangle \in \text{GIn}_\Sigma(\langle \mathcal{A}, \leq \rangle)$. We conclude that $\text{GIn}(\mathbf{K}) \leq \text{GIn}(\langle \mathcal{A}, \leq \rangle)$. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems.

- $\mathbf{K}$ is called an **inequational class** if there exists $I \leq \text{In}(\mathbf{F})$, such that $\mathbf{K} = \text{PAlgSys}(I)$;
- $\mathbf{K}$ is called a **quasi inequational class** if there exists $Q \leq \text{QIn}(\mathbf{F})$, such that $\mathbf{K} = \text{PAlgSys}(Q)$;
- $\mathbf{K}$ is called a **guasi inequational class** if there exists $G \leq \text{GIn}(\mathbf{F})$, such that $\mathbf{K} = \text{PAlgSys}(G)$.

Clearly, by definition, if $\mathbf{K}$ is an inequational class, then it is a quasi inequational class and, if it is a quasi inequational class, then it is a guasi inequational class.

Directly by these definitions and Lemma 1851, we get

Corollary 1852 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. If $\mathbf{K}$ is a quasi inequational class (and, hence, a fortiori, if it is a quasi inequational class or an inequational class), then it is abstract.*

Proof: Suppose $\mathbf{K}$ is a quasi inequational class defined by the $\mathbf{F}$ -guasi inequations $G \leq \mathbf{GIn}(\mathbf{F})$ and let $\langle \mathcal{A}, \leq \rangle \in \mathbf{C}(\mathbf{K})$. Then, by Lemma 1851, $\mathbf{GIn}(\mathbf{K}) \leq \mathbf{GIn}(\langle \mathcal{A}, \leq \rangle)$, whence

$$\begin{aligned} \langle \mathcal{A}, \leq \rangle &\in \mathbf{PAlgSys}(\mathbf{GIn}(\mathcal{A})) \\ &\subseteq \mathbf{PAlgSys}(\mathbf{GIn}(\mathbf{K})) \\ &= \mathbf{PAlgSys}(\mathbf{GIn}(\mathbf{PAlgSys}(G))) \\ &= \mathbf{PAlgSys}(G) \\ &= \mathbf{K}. \end{aligned}$$

Thus, $\mathbf{K}$ is an abstract class. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. We define:

- The **semantic order variety generated by $\mathbf{K}$**

$$\mathbf{VO}^{\text{Sem}}(\mathbf{K}) = \{ \langle \mathcal{A}, \leq \rangle \in \mathbf{PAlgSys}(\mathbf{F}) : \mathbf{In}(\mathbf{K}) \leq \mathbf{In}(\langle \mathcal{A}, \leq \rangle) \};$$

- The **semantic order quasivariety generated by $\mathbf{K}$**

$$\mathbf{QO}^{\text{Sem}}(\mathbf{K}) = \{ \langle \mathcal{A}, \leq \rangle \in \mathbf{PAlgSys}(\mathbf{F}) : \mathbf{QIn}(\mathbf{K}) \leq \mathbf{QIn}(\langle \mathcal{A}, \leq \rangle) \};$$

- The **semantic order guasivariety generated by $\mathbf{K}$**

$$\mathbf{GO}^{\text{Sem}}(\mathbf{K}) = \{ \langle \mathcal{A}, \leq \rangle \in \mathbf{PAlgSys}(\mathbf{F}) : \mathbf{GIn}(\mathbf{K}) \leq \mathbf{GIn}(\langle \mathcal{A}, \leq \rangle) \}.$$

We have the following obvious relations between these classes.

Lemma 1853 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. Then*

$$\mathbf{K} \subseteq \mathbf{GO}^{\text{Sem}}(\mathbf{K}) \subseteq \mathbf{QO}^{\text{Sem}}(\mathbf{K}) \subseteq \mathbf{VO}^{\text{Sem}}(\mathbf{K}).$$

Proof: The essential observation is that

$$\mathbf{In}(\mathbf{K}) \leq \mathbf{QIn}(\mathbf{K}) \leq \mathbf{GIn}(\mathbf{K}).$$

Thus, we get

$$\begin{aligned} &\{ \langle \mathcal{A}, \leq \rangle \in \mathbf{PAlgSys}(\mathbf{F}) : (\forall g \in \mathbf{GIn}(\mathbf{K}))(\langle \mathcal{A}, \leq \rangle \models g) \} \\ &\subseteq \{ \langle \mathcal{A}, \leq \rangle \in \mathbf{PAlgSys}(\mathbf{F}) : (\forall q \in \mathbf{QIn}(\mathbf{K}))(\langle \mathcal{A}, \leq \rangle \models q) \} \\ &\subseteq \{ \langle \mathcal{A}, \leq \rangle \in \mathbf{PAlgSys}(\mathbf{F}) : (\forall e \in \mathbf{In}(\mathbf{K}))(\langle \mathcal{A}, \leq \rangle \models e) \}. \end{aligned}$$

In other words, $\mathbf{K} \subseteq \mathbf{GO}^{\text{Sem}}(\mathbf{K}) \subseteq \mathbf{QO}^{\text{Sem}}(\mathbf{K}) \subseteq \mathbf{VO}^{\text{Sem}}(\mathbf{K})$. ■

Given a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems

- $\mathbf{K}$ is a **semantic order variety** if $\mathbf{VO}^{\text{Sem}}(\mathbf{K}) = \mathbf{K}$;
- $\mathbf{K}$ is a **semantic order quasivariety** if $\mathbf{QO}^{\text{Sem}}(\mathbf{K}) = \mathbf{K}$;
- $\mathbf{K}$ is a **semantic order guasivariety** if $\mathbf{GO}^{\text{Sem}}(\mathbf{K}) = \mathbf{K}$.

We have the following result identifying inequational classes with semantic order varieties, quasi inequational classes with semantic order quasivarieties and guasi inequational classes with semantic order guasivarieties.

Proposition 1854 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems.*

- (a) $\mathbf{K}$ is an inequational class iff it is a semantic order variety;
- (b) $\mathbf{K}$ is a quasi inequational class iff it is a semantic order quasivariety;
- (c) $\mathbf{K}$ is a guasi inequational class iff it is a semantic order guasivariety.

Proof:

- (a) Suppose, first, that $\mathbf{K}$ is an inequational class. Then, there exists $I \leq \text{In}(\mathbf{F})$, such that $\mathbf{K} = \text{PAlgSys}(I)$. Let $\langle \mathcal{A}, \leq \rangle \in \text{PAlgSys}(\mathbf{F})$, such that $\text{In}(\mathbf{K}) \leq \text{In}(\langle \mathcal{A}, \leq \rangle)$. Then we have $\langle \mathcal{A}, \leq \rangle \in \text{PAlgSys}(\text{In}(\langle \mathcal{A}, \leq \rangle)) \subseteq \text{PAlgSys}(\text{In}(\mathbf{K})) = \text{PAlgSys}(\text{In}(\text{PAlgSys}(I))) = \text{PAlgSys}(I) = \mathbf{K}$. Therefore, $\mathbf{K}$ is a semantic order variety.

Suppose, conversely, that $\mathbf{K}$ is a semantic order variety. Set $I = \text{In}(\mathbf{K})$. Then $\mathbf{K} \subseteq \text{PAlgSys}(\text{In}(\mathbf{K})) = \text{PAlgSys}(I)$. On the other hand, if $\langle \mathcal{A}, \leq \rangle \in \text{PAlgSys}(I)$, then

$$\text{In}(\mathbf{K}) = \text{In}(\text{PAlgSys}(\text{In}(\mathbf{K}))) = \text{In}(\text{PAlgSys}(I)) \leq \text{In}(\langle \mathcal{A}, \leq \rangle),$$

whence, by hypothesis, $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$. Therefore, $\mathbf{K} = \text{PAlgSys}(I)$ and $\mathbf{K}$ is an inequational class.

- (b) Suppose, first, that $\mathbf{K}$ is a quasi inequational class. Then, there exists $Q \leq \text{QIn}(\mathbf{F})$, such that $\mathbf{K} = \text{PAlgSys}(Q)$. Let $\langle \mathcal{A}, \leq \rangle \in \text{PAlgSys}(\mathbf{F})$, such that $\text{QIn}(\mathbf{K}) \leq \text{QIn}(\langle \mathcal{A}, \leq \rangle)$. Then we have

$$\begin{aligned} \langle \mathcal{A}, \leq \rangle &\in \text{PAlgSys}(\text{QIn}(\langle \mathcal{A}, \leq \rangle)) \\ &\subseteq \text{PAlgSys}(\text{QIn}(\mathbf{K})) \\ &= \text{PAlgSys}(\text{QIn}(\text{PAlgSys}(Q))) \\ &= \text{PAlgSys}(Q) \\ &= \mathbf{K}. \end{aligned}$$

Therefore, $\mathbf{K}$ is a semantic order quasivariety.

Suppose, conversely, that $\mathbf{K}$ is a semantic order quasivariety. Set $Q = \text{QIn}(\mathbf{K})$. Then $\mathbf{K} \subseteq \text{PAlgSys}(\text{QIn}(\mathbf{K})) = \text{PAlgSys}(Q)$. On the other hand, if $\langle \mathcal{A}, \leq \rangle \in \text{PAlgSys}(Q)$, then

$$\text{QIn}(\mathbf{K}) = \text{QIn}(\text{PAlgSys}(\text{QIn}(\mathbf{K}))) = \text{QIn}(\text{PAlgSys}(Q)) \leq \text{QIn}(\langle \mathcal{A}, \leq \rangle),$$

whence, by hypothesis, $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$. Therefore, $\mathbf{K} = \text{PAlgSys}(Q)$ and $\mathbf{K}$ is a quasi inequational class.

(c) Very similar to Part (b). ■

We introduce, next, some operators on classes of $\mathbf{F}$ -algebraic posystems, paralleling those introduced previously for classes of $\mathbf{F}$ -algebraic systems, that will serve to provide different characterizations to the inequational, quasi inequational and quasi inequational classes of $\mathbf{F}$ -algebraic posystems.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\langle \mathcal{A}, \leq \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\langle \mathcal{A}^i, \leq^i \rangle$, with $\mathcal{A}^i = \langle \mathbf{A}^i, \langle F^i, \alpha^i \rangle \rangle$, $i \in I$, $\mathbf{F}$ -algebraic posystems and $\langle H^i, \gamma^i \rangle : \langle \mathcal{A}, \leq \rangle \rightarrow \langle \mathcal{A}^i, \leq^i \rangle$, $i \in I$, surjective morphisms. We say the collection

$$\langle H^i, \gamma^i \rangle : \langle \mathcal{A}, \leq \rangle \rightarrow \langle \mathcal{A}^i, \leq^i \rangle, \quad i \in I,$$

is a **subdirect intersection** if

$$\bigcap_{i \in I} (\gamma^i)^{-1}(\leq^i) = \leq.$$

Note that this implies that

$$\bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle) = \Delta^{\mathcal{A}}.$$

Indeed, we have

$$\begin{aligned} \bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle) &= \bigcap_{i \in I} ((\gamma^i)^{-1}(\leq^i) \cap (\gamma^i)^{-1}(\leq^i)^{-1}) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\leq^i) \cap \bigcap_{i \in I} (\gamma^i)^{-1}(\leq^i)^{-1} \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\leq^i) \cap (\bigcap_{i \in I} (\gamma^i)^{-1}(\leq^i))^{-1} \\ &= \leq \cap (\leq)^{-1} \\ &= \Delta^{\mathcal{A}}. \end{aligned}$$

Given a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems, we write $\langle \mathcal{A}, \leq \rangle \in \overset{\triangleleft}{\Pi}(\mathbf{K})$ in case there exists a subdirect intersection $\{\langle H^i, \gamma^i \rangle : \langle \mathcal{A}, \leq \rangle \rightarrow \langle \mathcal{A}^i, \leq^i \rangle, i \in I\}$, with $\langle \mathcal{A}^i, \leq^i \rangle \in \mathbf{K}$, for all $i \in I$. If $\overset{\triangleleft}{\Pi}(\mathbf{K}) = \mathbf{K}$, we say that $\mathbf{K}$ is **closed under subdirect intersections**.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $\leq$ a posystem on $\mathcal{A}$. A congruence system $\theta \in$

$\text{ConSys}(\mathcal{A})$ is said to be **compatible with** $\leq$ if, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \phi', \psi, \psi' \in \text{SEN}(\Sigma)$,

$$\begin{array}{ccc} \phi & \xrightarrow{\leq_\Sigma} & \psi \\ \theta_\Sigma \downarrow & & \downarrow \theta_\Sigma \\ \phi' & \xrightarrow{\leq_\Sigma} & \psi' \end{array}$$

$$\phi \leq_\Sigma \psi, \quad \phi \theta_\Sigma \phi' \quad \text{and} \quad \psi \theta_\Sigma \psi' \quad \text{imply} \quad \phi' \leq_\Sigma \psi'.$$

A congruence system $\theta \in \text{ConSys}(\mathcal{A})$ is said to be a **congruence system on the $\mathbf{F}$ -algebraic posystem** $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$ if it is compatible with $\leq^{\mathcal{A}}$. We write $\text{ConSys}(\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle)$ for the collection of all congruence systems on $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\langle \mathcal{A}, \leq \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, an $\mathbf{F}$ -algebraic posystem and $\{\theta^i : i \in I\} \subseteq \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$ a (upward) directed collection of congruence systems on $\langle \mathcal{A}, \leq \rangle$. It is not difficult to show that $\bigcup_{i \in I} \theta^i \in \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$.

Lemma 1855 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\langle \mathcal{A}, \leq \rangle$ an $\mathbf{F}$ -algebraic posystem and $\{\theta^i : i \in I\} \subseteq \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$ a directed collection of congruence systems on $\langle \mathcal{A}, \leq \rangle$. Then $\bigcup_{i \in I} \theta^i$ is a congruence system on $\langle \mathcal{A}, \leq \rangle$.*

Proof: We know, by Lemma ?? that $\bigcup_{i \in I} \theta_\Sigma^i$ is a congruence system on $\mathcal{A}$. Thus, it suffices to show that it is compatible with $\leq$. To this end, suppose $\Sigma \in |\mathbf{Sign}|$, $\phi, \phi', \psi, \psi' \in \text{SEN}(\Sigma)$, such that $\phi \leq_\Sigma \psi$, $\phi \bigcup_{i \in I} \theta_\Sigma^i \phi'$ and $\psi \bigcup_{i \in I} \theta_\Sigma^i \psi'$. Thus, there exist $j \in I$ and $j' \in I$, such that $\phi \theta_\Sigma^j \phi'$ and $\psi \theta_\Sigma^{j'} \psi'$. But $\{\theta^i\}_{i \in I}$ is directed, whence, there exists $k \in I$, such that $\phi \theta_\Sigma^k \phi'$ and $\psi \theta_\Sigma^k \psi'$. Therefore, since $\theta^k \in \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$, we get $\phi' \leq_\Sigma \psi'$. We conclude that $\bigcup_{i \in I} \theta^i \in \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$. ■

Due to Lemma 1855, it makes sense to consider the quotient $\langle \mathcal{A}, \leq \rangle / \bigcup_{i \in I} \theta^i$. This $\mathbf{F}$ -algebraic posystem is called the **directed union** of the collection $\langle \mathcal{A}, \leq \rangle / \theta^i$. Given a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems, we write $\langle \mathcal{A}, \leq \rangle / \bigcup_{i \in I} \theta^i \in \mathbf{U}(\mathbf{K})$ in case $\langle \mathcal{A}, \leq \rangle / \theta^i \in \mathbf{K}$, for all $i \in I$. If $\mathbf{U}(\mathbf{K}) = \mathbf{K}$, we say that $\mathbf{K}$ is **closed under directed unions**.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\langle \mathcal{B}, \leq^{\mathcal{B}} \rangle$, with $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$, $\mathbf{F}$ -algebraic posystems and

$$\langle H, \gamma \rangle : \langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \rightarrow \langle \mathcal{B}, \leq^{\mathcal{B}} \rangle$$

a surjective morphism. In this case we say $\langle \mathcal{B}, \leq^{\mathcal{B}} \rangle$ is an **morphic image** of $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle$. Given a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems, we write $\langle \mathcal{B}, \leq^{\mathcal{B}} \rangle \in \mathbf{H}(\mathbf{K})$ in case there exists a surjective morphism

$$\langle H, \gamma \rangle : \langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \rightarrow \langle \mathcal{B}, \leq^{\mathcal{B}} \rangle,$$

with $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \in \mathbf{K}$. If $\mathbf{H}(\mathbf{K}) = \mathbf{K}$, we say that $\mathbf{K}$ is **closed under morphic images**.

It is not difficult to verify that all three operators are closure operators on classes of $\mathbf{F}$ -algebraic posystems.

Proposition 1856 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system. Then the operators $\overset{\triangleleft}{\Pi\Pi}$, $\mathbf{U}$ and $\mathbf{H}$ on classes of $\mathbf{F}$ -algebraic posystems are closure operators.*

Proof: We first look at $\overset{\triangleleft}{\Pi\Pi}$. Suppose $\mathbf{K}$ is a class of $\mathbf{F}$ -algebraic posystems.

- If $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$, then $\{\langle I, \iota \rangle : \langle \mathcal{A}, \leq \rangle \rightarrow \langle \mathcal{A}, \leq \rangle\}$, where $\langle I, \iota \rangle : \mathcal{A} \rightarrow \mathcal{A}$ is the identity morphism, is a subdirect intersection family. Thus, we get that $\langle \mathcal{A}, \leq \rangle \in \overset{\triangleleft}{\Pi\Pi}(\mathbf{K})$. Hence $\mathbf{K} \subseteq \overset{\triangleleft}{\Pi\Pi}(\mathbf{K})$ and $\overset{\triangleleft}{\Pi\Pi}$ is inflationary;
- It is obvious that $\overset{\triangleleft}{\Pi\Pi}$ is monotonic;
- Suppose that $\langle \mathcal{A}, \leq \rangle \in \overset{\triangleleft}{\Pi\Pi}(\overset{\triangleleft}{\Pi\Pi}(\mathbf{K}))$. Then, there exists a subdirect intersection family

$$\{\langle H^i, \gamma^i \rangle : \langle \mathcal{A}, \leq \rangle \rightarrow \langle \mathcal{A}^i, \leq^i \rangle, i \in I\},$$

with $\langle \mathcal{A}^i, \leq^i \rangle \in \overset{\triangleleft}{\Pi\Pi}(\mathbf{K})$, for all $i \in I$. Therefore, for each $i \in I$, there exists a subdirect intersection family

$$\{\langle H^{ij}, \gamma^{ij} \rangle : \langle \mathcal{A}^i, \leq^i \rangle \rightarrow \langle \mathcal{A}^{ij}, \leq^{ij} \rangle, j \in J_i\},$$

with $\langle \mathcal{A}^{ij}, \leq^{ij} \rangle \in \mathbf{K}$, for all $i \in I$ and all $j \in J_i$. Consider

$$\{\langle H^{ij}, \gamma^{ij} \rangle \circ \langle H^i, \gamma^i \rangle : \langle \mathcal{A}, \leq \rangle \rightarrow \langle \mathcal{A}^{ij}, \leq^{ij} \rangle, i \in I, j \in J_i\}.$$

It is a subdirect intersection family, since

$$\begin{aligned} \bigcap_{i \in I, j \in J_i} (\gamma^{ij} \circ \gamma^i)^{-1}(\leq^{ij}) &= \bigcap_{i \in I, j \in J_i} (\gamma^i)^{-1}((\gamma^{ij})^{-1}(\leq^{ij})) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\bigcap_{j \in J_i} (\gamma^{ij})^{-1}(\leq^{ij})) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1}(\leq^i) \\ &= \leq. \end{aligned}$$

Since $\langle \mathcal{A}^{ij}, \leq^{ij} \rangle \in \mathbf{K}$, for all $i \in I, j \in J_i$, we get that $\overset{\triangleleft}{\Pi\Pi}(\overset{\triangleleft}{\Pi\Pi}(\mathbf{K})) \subseteq \overset{\triangleleft}{\Pi\Pi}(\mathbf{K})$ and $\overset{\triangleleft}{\Pi\Pi}$ is idempotent.

Thus, $\overset{\triangleleft}{\Pi\Pi}$ is a closure operator.

Now we turn to $\mathbf{U}$. Suppose, again, that $\mathbf{K}$ is a class of $\mathbf{F}$ -algebraic posystems.

- If $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$, we look at the singleton family $\{\Delta^{\mathcal{A}}\}$, consisting of the identity congruence system on $\langle \mathcal{A}, \leq \rangle$. Clearly, it is directed and its union is $\Delta^{\mathcal{A}}$. Therefore, $\langle \mathcal{A}, \leq \rangle \cong \langle \mathcal{A}, \leq \rangle / \Delta^{\mathcal{A}} \in \mathbf{U}(\mathbf{K})$;
- Monotonicity is obvious in this case as well;
- Suppose that $\langle \mathcal{A}, \leq \rangle / \theta \in \mathbf{U}(\mathbf{U}(\mathbf{K}))$. Then $\theta = \bigcup_{i \in I} \theta^i$ for a directed family $\{\theta^i : i \in I\} \subseteq \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$, such that $\langle \mathcal{A}, \leq \rangle / \theta^i \in \mathbf{U}(\mathbf{K})$, for all $i \in I$. Thus, for all $i \in I$, $\theta^i = \bigcup_{j \in J_i} \theta^{ij}$ for a directed family $\{\theta^{ij} : j \in J_i\} \subseteq \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$, such that $\langle \mathcal{A}, \leq \rangle / \theta^{ij} \in \mathbf{K}$, for all $j \in J_i$. Now, let $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\langle \phi, \psi \rangle \in \theta_{\Sigma}^{ij_i} \cup \theta_{\Sigma}^{i'j_{i'}}$. By hypothesis, $\langle \phi, \psi \rangle \in \theta_{\Sigma}^i \cup \theta_{\Sigma}^{i'}$. Hence, since $\{\theta^i : i \in I\}$ is directed, there exists $k \in I$, such that $\langle \phi, \psi \rangle \in \theta_{\Sigma}^k$. Thus, again, by the hypothesis, there exists, $j_k \in J_k$, such that $\langle \phi, \psi \rangle \in \theta^{kj_k}$. We conclude that the collection $\{\theta^{ij} : j \in J_i, i \in I\}$ is directed, such that $\langle \mathcal{A}, \leq \rangle / \theta^{ij} \in \mathbf{K}$, for all $i \in I, j \in J_i$, and, moreover, $\theta = \bigcup_{i \in I} \theta^i = \bigcup_{i \in I} \bigcup_{j \in J_i} \theta^{ij} = \bigcup_{i \in I, j \in J_i} \theta^{ij}$. Thus, $\langle \mathcal{A}, \leq \rangle / \theta \in \mathbf{U}(\mathbf{K})$ and $\mathbf{U}$ is also idempotent.

Therefore, $\mathbf{U}$ is also a closure operator.

Finally, we deal with $\mathbf{H}$, which is the easiest case. Let $\mathbf{K}$ be a class of $\mathbf{F}$ -algebraic posystems. If $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$, then, using again the identity $\langle I, \iota \rangle : \langle \mathcal{A}, \leq \rangle \rightarrow \langle \mathcal{A}, \leq \rangle$, we see that $\langle \mathcal{A}, \leq \rangle \in \mathbf{H}(\mathbf{K})$, and, hence, $\mathbf{H}$ is inflationary. It is again obvious that it is monotonic. Finally, if $\mathcal{A} \in \mathbf{H}(\mathbf{H}(\mathbf{K}))$, then, there exists a surjective morphism $\langle G, \beta \rangle : \langle \mathcal{A}', \leq' \rangle \rightarrow \langle \mathcal{A}, \leq \rangle$, with $\langle \mathcal{A}', \leq' \rangle \in \mathbf{H}(\mathbf{K})$, whence, there also exists a surjective morphism $\langle H, \gamma \rangle : \langle \mathcal{A}'', \leq'' \rangle \rightarrow \langle \mathcal{A}', \leq' \rangle$, with $\langle \mathcal{A}'', \leq'' \rangle \in \mathbf{K}$. Now the surjective morphism

$$\langle G, \beta \rangle \circ \langle H, \gamma \rangle : \langle \mathcal{A}'', \leq'' \rangle \rightarrow \langle \mathcal{A}, \leq \rangle$$

witnesses the fact that $\langle \mathcal{A}, \leq \rangle \in \mathbf{H}(\mathbf{K})$. Therefore, $\mathbf{H}(\mathbf{H}(\mathbf{K})) \subseteq \mathbf{H}(\mathbf{K})$, and $\mathbf{H}$ is idempotent. Thus, $\mathbf{H}$ is a closure operator. $\blacksquare$

We show next that, if a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems is closed under morphic images, then it is also closed under directed unions.

Proposition 1857 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ be a class of $\mathbf{F}$ -algebraic posystems. If $\mathbf{K}$ is closed under morphic images, then it is closed under directed unions.*

Proof: Suppose $\mathbf{K}$ is closed under $\overset{\triangleleft}{\mathbf{III}}$ and $\mathbf{H}$ and let $\langle \mathcal{A}, \leq \rangle$, with $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, be an $\mathbf{F}$ -algebraic posystem and $\{\theta^i : i \in I\} \subseteq \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$, a directed family of congruence systems, such that $\langle \mathcal{A}, \leq \rangle / \theta^i \in \mathbf{K}$. Consider a morphism

$$\langle I, \pi^i \rangle : \langle \mathcal{A}, \leq \rangle / \theta^i \rightarrow \langle \mathcal{A}, \leq \rangle / \bigcup_{i \in I} \theta^i,$$

given, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{SEN}(\Sigma)$, by

$$\pi_{\Sigma}^i(\phi/\theta_{\Sigma}^i) = \phi/\bigcup_{i \in I} \theta_{\Sigma}^i.$$

It is well defined, since, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$, if $\langle \phi, \psi \rangle \in \theta_{\Sigma}^i$, then, automatically, $\langle \phi, \psi \rangle \in \bigcup_{i \in I} \theta_{\Sigma}^i$. Therefore, since $\langle \mathcal{A}, \leq \rangle / \theta^i \in \mathbf{K}$, we get, by hypothesis, $\langle \mathcal{A}, \leq \rangle / \bigcup_{i \in I} \theta^i \in \mathbf{H}(\mathbf{K}) = \mathbf{K}$. We conclude that $\mathbf{U}(\mathbf{K}) \subseteq \mathbf{K}$ and, hence, $\mathbf{K}$ is closed under directed unions. ■

We are now ready to provide alternative characterizations of inequational, quasi inequational and guasi inequational classes of $\mathbf{F}$ -algebraic posystems. Namely, we show that an abstract class of $\mathbf{F}$ -algebraic posystems is a guasi inequational class if and only if it is closed under subdirect intersections, that it is a quasi inequational class if and only if it is closed under subdirect intersections and directed unions and that it is an inequational class if and only if it is closed under subdirect intersections and morphic images.

Theorem 1858 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ an abstract class of $\mathbf{F}$ -algebraic posystems. $\mathbf{K}$ is a guasi inequational class if and only if it is closed under subdirect intersections.*

Proof: Suppose, first, that $\mathbf{K}$ is a guasi inequational class and consider a subdirect intersection

$$\{\langle H^i, \gamma^i \rangle : \langle \mathcal{A}, \leq \rangle \rightarrow \langle \mathcal{A}^i, \leq^i \rangle, i \in I\},$$

with $\langle \mathcal{A}^i, \leq^i \rangle \in \mathbf{K}$. Let G be the set of guasi inequations defining $\mathbf{K}$ and $\Sigma \in |\mathbf{Sign}^b|$, $\langle \vec{\phi} \preceq \vec{\psi}, \phi \preceq \psi \rangle \in G_{\Sigma}$, such that, for some $\Sigma' \in |\mathbf{Sign}^b|$ and $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_j)) \leq_{F(\Sigma')} \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi_j)), \text{ for all } j \in J.$$

Then we get $\gamma_{F(\Sigma')}^i(\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi_j))) \leq_{H^i(F(\Sigma'))}^i \gamma_{F(\Sigma')}^i(\alpha_{\Sigma'}(\text{SEN}^b(f)(\psi_j)))$, for all $i \in I$, $j \in J$. This gives $\alpha_{\Sigma'}^i(\text{SEN}^b(f)(\phi_j)) \leq_{F^i(\Sigma')}^i \alpha_{\Sigma'}^i(\text{SEN}^b(f)(\psi_j))$, for all $i \in I$, $j \in J$. Since $\langle \mathcal{A}^i, \leq^i \rangle \in \mathbf{K}$, for all $i \in I$, and $\langle \vec{\phi} \preceq \vec{\psi}, \phi \preceq \psi \rangle \in G_{\Sigma}$, we get that $\alpha_{\Sigma'}^i(\text{SEN}^b(f)(\phi)) \leq_{F^i(\Sigma')}^i \alpha_{\Sigma'}^i(\text{SEN}^b(f)(\psi))$, for all $i \in I$. Equivalently, $\gamma_{F(\Sigma')}^i(\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi))) \leq_{H^i(F(\Sigma'))}^i \gamma_{F(\Sigma')}^i(\alpha_{\Sigma'}(\text{SEN}^b(f)(\psi)))$, for all $i \in I$, i.e.,

$$\langle \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)), \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi)) \rangle \in \bigcap_{i \in I} (\gamma_{F(\Sigma')}^i)^{-1}(\leq^i).$$

Since $\{\langle H^i, \gamma^i \rangle : i \in I\}$ is a subdirect intersection, we get

$$\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \leq_{F(\Sigma')} \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi)).$$

We conclude that $\langle \mathcal{A}, \leq \rangle \in \text{PAlgSys}(G) = \mathbf{K}$. Hence, $\mathbf{K}$ is closed under subdirect intersections.

Assume, conversely, that $\mathbf{K}$ is closed under subdirect intersections and set $G = \text{GIn}(\mathbf{K})$. Let $\langle \mathcal{A}, \leq \rangle \in \text{PAlgSys}(\mathbf{F})$, such that $G \leq \text{GIn}(\langle \mathcal{A}, \leq \rangle)$. Let $\Sigma \in |\mathbf{Sign}^b|$, such that $\phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle)$, i.e., for some $\Sigma' \in |\mathbf{Sign}^b|$ and some $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, $\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \not\leq_{F(\Sigma')} \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi))$. Thus, by definition, the guasi inequation $\langle \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle), \phi \leq \psi \rangle \notin \text{GIn}_\Sigma(\mathbf{K})$. Therefore, since $G \leq \text{GIn}(\langle \mathcal{A}, \leq \rangle)$, $\langle \text{In}_\Sigma(\mathcal{A}), \phi \leq \psi \rangle \notin \text{GIn}_\Sigma(\mathbf{K})$. Hence, for every $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle)$, there exists $\langle \mathcal{K}^{\langle \Sigma, \phi, \psi \rangle}, \leq^{\langle \Sigma, \phi, \psi \rangle} \rangle \in \mathbf{K}$, such that

$$\begin{aligned} \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) &\subseteq \text{In}_\Sigma(\langle \mathcal{K}^{\langle \Sigma, \phi, \psi \rangle}, \leq^{\langle \Sigma, \phi, \psi \rangle} \rangle), \\ \phi \leq \psi &\notin \text{In}_\Sigma(\langle \mathcal{K}^{\langle \Sigma, \phi, \psi \rangle}, \leq^{\langle \Sigma, \phi, \psi \rangle} \rangle). \end{aligned}$$

We conclude that

$$\text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) = \bigcap \{ \text{In}_\Sigma(\langle \mathcal{K}^{\langle \Sigma, \phi, \psi \rangle}, \leq^{\langle \Sigma, \phi, \psi \rangle} \rangle) : \phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) \}.$$

Denote, for all $\Sigma \in |\mathbf{Sign}^b|$, $\mathbf{K}^\Sigma = \{ \langle \mathcal{K}^{\langle \Sigma, \phi, \psi \rangle}, \leq^{\langle \Sigma, \phi, \psi \rangle} \rangle : \phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) \}$, for brevity.

- Since $\mathbf{K}$ is closed under subdirect intersections, and

$$\{ \langle F^\mathcal{K}, \alpha^\mathcal{K} \rangle : \langle \mathcal{F}, \bigcap_{\langle \mathcal{K}, \leq^\mathcal{K} \rangle \in \mathbf{K}^\Sigma} (\alpha^\mathcal{K})^{-1}(\leq^\mathcal{K}) \rangle / \text{Eq}(\mathbf{K}^\Sigma) \rightarrow \langle \mathcal{K}, \leq^\mathcal{K} \rangle, \langle \mathcal{K}, \leq^\mathcal{K} \rangle \in \mathbf{K}^\Sigma \}$$

is a subdirect intersection, we get that

$$\langle \mathcal{F}, \bigcap_{\langle \mathcal{K}, \leq^\mathcal{K} \rangle \in \mathbf{K}^\Sigma} (\alpha^\mathcal{K})^{-1}(\leq^\mathcal{K}) \rangle / \text{Eq}(\mathbf{K}^\Sigma) \in \mathbf{K}.$$

- Since, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\begin{aligned} \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) &= \text{In}_\Sigma(\mathbf{K}^\Sigma) \\ &= \text{In}_\Sigma(\langle \mathcal{F}, \bigcap_{\langle \mathcal{K}, \leq^\mathcal{K} \rangle \in \mathbf{K}^\Sigma} (\alpha^\mathcal{K})^{-1}(\leq^\mathcal{K}) \rangle / \text{Eq}(\mathbf{K}^\Sigma)) \end{aligned}$$

and $\langle \mathcal{F}, \bigcap_{\langle \mathcal{K}, \leq^\mathcal{K} \rangle \in \mathbf{K}^\Sigma} (\alpha^\mathcal{K})^{-1}(\leq^\mathcal{K}) \rangle / \text{Eq}(\mathbf{K}^\Sigma) \in \mathbf{K}$, $\langle \mathcal{A}, \leq \rangle \in \mathbf{C}(\mathbf{K})$. Since $\mathbf{K}$ is abstract, we conclude that $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$.

Hence, $\mathbf{K}$ is indeed a guasi inequational class of $\mathbf{F}$ -algebraic posystems. $\blacksquare$

Theorem 1859 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ an abstract class of $\mathbf{F}$ -algebraic posystems. $\mathbf{K}$ is a quasi inequational class if and only if it is closed under subdirect intersections and directed unions.*

Proof: Suppose, first, that $\mathbf{K}$ is a quasi inequational class, defined by a collection Q of $\mathbf{F}$ -quasi inequations. Then it is a guasi inequational class and, therefore, by Theorem 1858, closed under subdirect intersections. Let

$\langle \mathcal{A}, \leq \rangle$ be an $\mathbf{F}$ -algebraic posystem and $\{\theta^i : i \in I\} \subseteq \text{ConSys}(\langle \mathcal{A}, \leq \rangle)$ a directed union of congruence systems on $\langle \mathcal{A}, \leq \rangle$, such that $\langle \mathcal{A}, \leq \rangle / \theta^i \in \mathbf{K}$, for all $i \in I$. Let $\Sigma \in |\mathbf{Sign}^b|$, $\langle \vec{\psi} \leq \vec{\psi}, \phi \leq \psi \rangle \in Q_\Sigma$, such that, for some $\Sigma' \in |\mathbf{Sign}^b|$ and $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\alpha_{\Sigma'}^{\bigcup_{i \in I} \theta^i}(\text{SEN}^b(f)(\phi_j)) \leq_{F(\Sigma')}^{\bigcup_{i \in I} \theta^i} \alpha_{\Sigma'}^{\bigcup_{i \in I} \theta^i}(\text{SEN}^b(f)(\psi_j)), \quad j < n.$$

Thus, for every $j < n$, there exists $k_j \in I$, such that

$$\alpha_{\Sigma'}^{\theta^{k_j}}(\text{SEN}^b(f)(\phi_j)) \leq_{F(\Sigma')}^{\theta^{k_j}} \alpha_{\Sigma'}^{\theta^{k_j}}(\text{SEN}^b(f)(\psi_j)).$$

Since $\{\theta^i : i \in I\}$ is directed, there exists $k \in I$, such that

$$\alpha_{\Sigma'}^{\theta^k}(\text{SEN}^b(f)(\phi_j)) \leq_{F(\Sigma')}^{\theta^k} \alpha_{\Sigma'}^{\theta^k}(\text{SEN}^b(f)(\psi_j)), \quad j < n.$$

Since $\langle \mathcal{A}, \leq \rangle / \theta^k \in \mathbf{K}$ and $\langle \vec{\psi} \leq \vec{\psi}, \phi \leq \psi \rangle \in Q_\Sigma$, we get that

$$\alpha_{\Sigma'}^{\bigcup_{i \in I} \theta^i}(\text{SEN}^b(f)(\phi)) \leq_{F(\Sigma')}^{\bigcup_{i \in I} \theta^i} \alpha_{\Sigma'}^{\bigcup_{i \in I} \theta^i}(\text{SEN}^b(f)(\psi)).$$

Therefore, $\langle \mathcal{A}, \leq \rangle / \bigcup_{i \in I} \theta^i \in \text{PAlgSys}(Q) = \mathbf{K}$ and $\mathbf{K}$ is closed under directed unions.

Suppose, conversely, that $\mathbf{K}$ is an abstract class of $\mathbf{F}$ -algebraic posystems closed under subdirect intersections and directed unions. Set $Q = \text{QIn}(\mathbf{K})$ and let $\langle \mathcal{A}, \leq \rangle \in \text{PAlgSys}(\mathbf{F})$, such that $Q \leq \text{QIn}(\mathcal{A})$. Let $\Sigma \in |\mathbf{Sign}^b|$, such that $\phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle)$, i.e., for some $\Sigma' \in |\mathbf{Sign}^b|$ and some $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, $\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \not\leq_{F(\Sigma')} \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi))$. Thus, by definition, for every finite $I \subseteq \text{In}_\Sigma(\mathcal{A})$ the quasi inequation $\langle I, \phi \leq \psi \rangle \notin \text{QIn}_\Sigma(\langle \mathcal{A}, \leq \rangle)$. Therefore, since $Q \leq \text{QIn}(\langle \mathcal{A}, \leq \rangle)$, $\langle I, \phi \leq \psi \rangle \notin \text{QIn}_\Sigma(\mathbf{K})$. Hence, for every $\Sigma \in |\mathbf{Sign}^b|$, all $I \subseteq_f \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle)$ and all $\phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle)$, there exists

$$\langle \mathcal{K}^{\langle \Sigma, I, \phi, \psi \rangle}, \leq^{\langle \Sigma, I, \phi, \psi \rangle} \rangle \in \mathbf{K},$$

such that

- $I \subseteq \text{In}_\Sigma(\langle \mathcal{K}^{\langle \Sigma, I, \phi, \psi \rangle}, \leq^{\langle \Sigma, I, \phi, \psi \rangle} \rangle)$;
- $\phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{K}^{\langle \Sigma, I, \phi, \psi \rangle}, \leq^{\langle \Sigma, I, \phi, \psi \rangle} \rangle)$.

We conclude that, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) = \bigcap \{ \bigcup \{ \text{In}_\Sigma(\mathcal{K}^{\langle \Sigma, I, \phi, \psi \rangle}, \leq^{\langle \Sigma, I, \phi, \psi \rangle}) : I \subseteq_f \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) \} : \phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) \}.$$

Denote, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle)$,

$$\mathbf{K}^{\langle \Sigma, \phi, \psi \rangle} = \{ \langle \mathcal{F}, (\alpha^{\langle \Sigma, I, \phi, \psi \rangle})^{-1}(\leq^{\langle \Sigma, I, \phi, \psi \rangle}) \rangle / \text{Eq}(\mathcal{K}^{\langle \Sigma, I, \phi, \psi \rangle}) : I \subseteq_f \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) \},$$

and, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\mathbf{K}^\Sigma = \{ \langle \mathcal{F}, \bigcup_{\mathcal{K} \in \mathbf{K}^{\langle \Sigma, \phi, \psi \rangle}} (\alpha^\mathcal{K})^{-1}(\leq^\mathcal{K}) \rangle / \bigcup_{\mathcal{K} \in \mathbf{K}^{\langle \Sigma, \phi, \psi \rangle}} \text{Eq}(\mathcal{K}) : \phi \leq \psi \notin \text{In}_\Sigma(\langle \mathcal{A}, \leq \rangle) \},$$

for brevity.

- Since $\mathbf{K}$ is closed under directed unions, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \leq \psi \notin \text{In}_\Sigma(\mathcal{A})$, we have $\langle \mathcal{F}, \bigcup_{\mathcal{K} \in \mathbf{K}(\Sigma, \phi, \psi)} (\alpha^\mathcal{K})^{-1}(\leq^\mathcal{K}) \rangle / \bigcup_{\mathcal{K} \in \mathbf{K}(\Sigma, \phi, \psi)} \text{Eq}(\mathcal{K}) \in \mathbf{K}$.
- Since $\mathbf{K}$ is closed under subdirect intersections,

$$\langle \mathcal{F}, \bigcap_{\mathcal{K} \in \mathbf{K}^\Sigma} (\alpha^\mathcal{K})^{-1}(\leq^\mathcal{K}) \rangle / \text{Eq}(\mathbf{K}^\Sigma) \in \mathbf{K},$$

for all $\Sigma \in |\mathbf{Sign}^b|$.

- Finally, noting that, for all $\Sigma \in |\mathbf{Sign}^b|$, $\langle \mathcal{F}, \bigcap_{\mathcal{K} \in \mathbf{K}^\Sigma} (\alpha^\mathcal{K})^{-1}(\leq^\mathcal{K}) \rangle / \text{Eq}(\mathbf{K}^\Sigma)$ is a Σ - $\mathbf{K}$ -certificate for $\mathcal{A}$, and, taking into account that $\mathbf{K}$ is abstract, we conclude that $\mathcal{A} \in \mathbf{K}$.

Therefore $\mathbf{K}$ is indeed a quasiequational class of $\mathbf{F}$ -algebraic systems. $\blacksquare$

25.2 Syntactic Order Algebraizability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. If $\mathcal{I}$ is equivalent to $\mathcal{I}^{\mathbf{K}, \leq}$ via a conjugate pair $(\alpha, \beta) : \mathcal{I} \rightleftarrows \mathcal{I}^{\mathbf{K}, \leq}$, we say that the class $\mathbf{K}$ **β -order algebraizes** the π -institution $\mathcal{I}$. Recall, in more detail, that this means that there exist a collection $\alpha : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , with a single distinguished argument and a collection $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b , with two distinguished arguments, such that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $\Phi \subseteq \text{SEN}^b(\Sigma)$ and $I \subseteq \text{In}_\Sigma(\mathbf{F})$,

1. $\phi \in C_\Sigma(\Phi)$ if and only if $\alpha_\Sigma[\phi] \leq C_\Sigma^{\mathbf{K}, \leq}(\alpha_\Sigma[\Phi])$;
2. $\phi \leq \psi \in C_\Sigma^{\mathbf{K}, \leq}(I)$ if and only if $\beta_\Sigma[\phi, \psi] \leq C(\beta_\Sigma[I])$;
3. $C^{\mathbf{K}, \leq}(\phi \leq \psi) = C^{\mathbf{K}, \leq}(\alpha[\beta_\Sigma[\phi, \psi]])$;
4. $C(\phi) = C(\beta[\alpha_\Sigma[\phi]])$.

Moreover, we say that $\mathcal{I}$ is **β -order algebraizable** if there exists a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems, such that $\mathbf{K}$ β -order algebraizes $\mathcal{I}$. In this case, we call the least order quasivariety including $\mathbf{K}$ the **β -ordered class of $\mathcal{I}$** and denote it by $\text{PAlgSys}(\mathcal{I})$.

Lemma 1860 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b having two distinguished arguments, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $\mathbf{K}, \mathbf{K}'$ two classes of $\mathbf{F}$ -algebraic posystems. If both $\mathbf{K}$ and $\mathbf{K}'$ β -order algebraize $\mathcal{I}$, then $\mathcal{I}^{\mathbf{K}, \leq} = \mathcal{I}^{\mathbf{K}', \leq}$. Therefore, $\text{GO}^{\text{Sem}}(\mathbf{K}) = \text{GO}^{\text{Sem}}(\mathbf{K}')$.*

Proof: Suppose both $\mathbf{K}$ and $\mathbf{K}'$ β -order algebraize $\mathcal{I}$. Then, we have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $I \cup \{\phi \leq \psi\} \in \text{In}_\Sigma(\mathbf{F})$,

$$\begin{aligned} \phi \leq \psi \in C_\Sigma^{\mathbf{K}, \leq}(I) & \text{ iff } \beta_\Sigma[\phi, \psi] \leq C(\beta_\Sigma[I]) \\ & \text{ iff } \phi \leq \psi \in C_\Sigma^{\mathbf{K}', \leq}(I). \end{aligned}$$

We conclude that $\mathcal{I}^{\mathbf{K}, \leq} = \mathcal{I}^{\mathbf{K}', \leq}$, whence the semantic order quasivarieties generated by $\mathbf{K}$ and $\mathbf{K}'$ coincide. $\blacksquare$

We call the unique semantic order quasivariety that β -order algebraizes $\mathcal{I}$ the **β -order class of $\mathcal{I}$** and denote it by $\text{PAlgSys}^\beta(\mathcal{I})$.

Next we show that if two families $\beta, \beta' : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b are deductively equivalent, in the sense that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $\beta_\Sigma[\phi, \psi]$ and $\beta'_\Sigma[\phi, \psi]$ are interderivable, then $\mathcal{I}$ is β -order algebraizable if and only if it is β' -order algebraizable and, in fact, in that case, the corresponding order classes of $\mathcal{I}$ coincide.

Lemma 1861 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta, \beta' : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b , with two distinguished arguments, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. If, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $C(\beta_\Sigma[\phi, \psi]) = C(\beta'_\Sigma[\phi, \psi])$, then $\mathcal{I}$ is β -order algebraizable if and only if $\mathcal{I}$ is β' -order algebraizable. In that case, the β - and β' -order classes of $\mathcal{I}$ coincide, i.e., $\text{PAlgSys}^\beta(\mathcal{I}) = \text{PAlgSys}^{\beta'}(\mathcal{I})$.*

Proof: Suppose that $\mathcal{I}$ is β -order algebraizable. Then, there exists a conjugate pair $(\alpha, \beta) : \mathcal{I} \rightleftarrows \mathcal{I}^{\mathbf{K}, \leq}$. We show that $\mathcal{I}$ is also β' -order algebraizable via the conjugate pair $(\alpha, \beta') : \mathcal{I} \rightleftarrows \mathcal{I}^{\mathbf{K}, \leq}$.

- We have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $I \cup \{\phi \leq \psi\} \in \text{In}_\Sigma(\mathbf{F})$,

$$\begin{aligned} \phi \leq \psi \in C_\Sigma^{\mathbf{K}, \leq}(I) & \text{ iff } \beta_\Sigma[\phi, \psi] \leq C(\beta_\Sigma[I]) \\ & \text{ iff } \beta'_\Sigma[\phi, \psi] \leq C(\beta'_\Sigma[I]). \end{aligned}$$

- $C(\phi) = C(\beta[\alpha_\Sigma[\phi]]) = C(\beta'[\alpha_\Sigma[\phi]])$.

Thus, by Proposition 901, $\mathcal{I}$ and $\mathcal{I}^{\mathbf{K}, \leq}$ are equivalent via (α, β') . By symmetry, we infer the first statement of the lemma. The second conclusion now follows directly from Lemma 1860, since the same class $\mathbf{K}$ both β - and β' -order algebraizes $\mathcal{I}$. $\blacksquare$

Moreover, we can show that the conjugate transformation α in a β -order algebraization is essentially unique, in the sense that any two of them are deductively equivalent modulo inequational derivability.

Lemma 1862 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b having two distinguished arguments, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$ and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. If $\mathbf{K}$ β -order*

algebraizes $\mathcal{I}$ via a conjugate pair $(\alpha, \beta) : \mathcal{I} \rightleftarrows \mathcal{I}^{K, \leq}$ and via a conjugate pair $(\alpha', \beta) : \mathcal{I} \rightleftarrows \mathcal{I}^{K, \leq}$, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$C^{K, \leq}(\alpha_\Sigma[\phi]) = C^{K, \leq}(\alpha'_\Sigma[\phi]).$$

Proof: We have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$\begin{aligned} \alpha_\Sigma[\phi] \leq C^{K, \leq}(\alpha'_\Sigma[\phi]) & \text{ iff } \beta[\alpha_\Sigma[\phi]] \leq C(\beta[\alpha'_\Sigma[\phi]]) \\ & \text{ iff } \phi \in C_\Sigma(\phi). \end{aligned}$$

Therefore, $\alpha_\Sigma[\phi] \leq C^{K, \leq}(\alpha'_\Sigma[\phi])$ and, hence, by symmetry, $C^{K, \leq}(\alpha_\Sigma[\phi]) = C^{K, \leq}(\alpha'_\Sigma[\phi])$. $\blacksquare$

We give next some conditions that are equivalent to $\vec{\beta}$ defining Leibniz congruence systems of theory families of $\mathcal{I}$. Recall that this is tantamount to $\mathcal{I}$ being syntactically protoalgebraic.

Theorem 1863 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b having two distinguished arguments and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) *For all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\beta^{\mathcal{A}}(T)$ is reflexive and antisymmetric;*
- (ii) *For all σ^b in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \vec{\chi} \in \text{SEN}^b(\Sigma)$,*
 - $\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I})$;
 - $\sigma_\Sigma^b(\psi, \vec{\chi}) \in C_\Sigma(\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \phi], \sigma_\Sigma^b(\phi, \vec{\chi}))$;
- (iii) *For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and every $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$\Omega^{\mathcal{A}}(T) = \vec{\beta}^{\mathcal{A}}(T).$$

Proof:

- (i) $\Rightarrow$ (ii) Suppose that, for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\beta^{\mathcal{A}}(T)$ is reflexive and antisymmetric and let $\sigma^b \in N^b$, $\Sigma \in |\mathbf{Sign}^b|$, and $\phi, \psi, \vec{\chi} \in \text{SEN}^b(\Sigma)$. Consider $\langle \mathcal{F}/\Omega(\text{Thm}(\mathcal{I})), \text{Thm}(\mathcal{I})/\Omega(\text{Thm}(\mathcal{I})) \rangle \in \text{MatFam}^*(\mathcal{I})$. Then, by hypothesis, $\langle \phi, \psi \rangle \in \beta_\Sigma^{\mathcal{F}/\Omega(\text{Thm}(\mathcal{I}))}(\text{Thm}(\mathcal{I}))$, i.e.,

$$\beta_\Sigma^{\mathcal{F}/\Omega(\text{Thm}(\mathcal{I}))}[\phi/\Omega_\Sigma(\text{Thm}(\mathcal{I})), \psi/\Omega_\Sigma(\text{Thm}(\mathcal{I}))] \leq \text{Thm}(\mathcal{I})/\Omega(\text{Thm}(\mathcal{I})).$$

This is equivalent to $\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I})$.

Assume, next, that for some $T \in \text{ThFam}(\mathcal{I})$, $\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \phi] \leq T$ and $\sigma_\Sigma^b(\phi, \vec{\chi}) \in T_\Sigma$. Then, we get

$$\begin{aligned} \beta_\Sigma^{\mathcal{F}/\Omega(T)}[\phi/\Omega_\Sigma(T), \psi/\Omega_\Sigma(T)] & \leq T/\Omega(T), \\ \beta_\Sigma^{\mathcal{F}/\Omega(T)}[\psi/\Omega_\Sigma(T), \phi/\Omega_\Sigma(T)] & \leq T/\Omega(T), \end{aligned}$$

i.e.,

$$\begin{aligned}\langle \phi/\Omega_\Sigma(T), \psi/\Omega_\Sigma(T) \rangle &\in \beta_\Sigma^{\mathcal{F}/\Omega(T)}(T/\Omega(T)), \\ \langle \psi/\Omega_\Sigma(T), \phi/\Omega_\Sigma(T) \rangle &\in \beta_\Sigma^{\mathcal{F}/\Omega(T)}(T/\Omega(T)).\end{aligned}$$

But on $\langle \mathcal{F}/\Omega(T), T/\Omega(T) \rangle \in \text{MatFam}^*(\mathcal{I})$, $\beta_\Sigma^{\mathcal{F}/\Omega(T)}(T/\Omega(T))$ is, by hypothesis, antisymmetric, whence we get $\langle \phi, \psi \rangle \in \Omega_\Sigma(T)$. Therefore, since $\sigma_\Sigma^b(\phi, \vec{\chi}) \in T_\Sigma$, we have, by compatibility, that $\sigma_\Sigma^b(\psi, \vec{\chi}) \in T_\Sigma$.

(ii) $\Rightarrow$ (iii) Suppose that Condition (ii) holds and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Let $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$.

– If $\langle \phi, \psi \rangle \in \Omega_\Sigma^{\mathcal{A}}(T)$, then, for all $\sigma^b \in \beta$ and all $\Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$, $\vec{\chi} \in \text{SEN}(\Sigma')$,

$$\begin{aligned}\langle \sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\phi), \text{SEN}(f)(\psi), \vec{\chi}), \\ \sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\phi), \text{SEN}(f)(\phi), \vec{\chi}) \rangle &\in \Omega_{\Sigma'}^{\mathcal{A}}(T), \\ \langle \sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\psi), \text{SEN}(f)(\phi), \vec{\chi}), \\ \sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\phi), \text{SEN}(f)(\phi), \vec{\chi}) \rangle &\in \Omega_{\Sigma'}^{\mathcal{A}}(T).\end{aligned}$$

Thus, by compatibility, $\beta_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$ and $\beta_\Sigma^{\mathcal{A}}[\psi, \phi] \leq T$, i.e., $\beta_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$. Thus, $\langle \phi, \psi \rangle \in \beta_\Sigma^{\mathcal{A}}(T)$.

– Suppose, conversely, that $\langle \phi, \psi \rangle \in \beta_\Sigma^{\mathcal{A}}(T)$, i.e., $\beta_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$ and $\beta_\Sigma^{\mathcal{A}}[\psi, \phi] \leq T$. Then, by hypothesis, we have, for all σ^b in N^b , all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\vec{\chi} \in \text{SEN}(\Sigma')$,

$$\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\phi), \vec{\chi}) \in T_{\Sigma'} \quad \text{iff} \quad \sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\psi), \vec{\chi}) \in T_{\Sigma'}.$$

Therefore, $\langle \phi, \psi \rangle \in \Omega^{\mathcal{A}}(T)$.

we conclude that $\beta_\Sigma^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(T)$.

(iii) $\Rightarrow$ (i) Finally, suppose that, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\beta_\Sigma^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(T)$ and let $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$. Then we get that $\beta_\Sigma^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(T) = \Delta^{\mathcal{A}}$. Thus, clearly, $\beta^{\mathcal{A}}(T)$ is reflexive and antisymmetric. ■

We obtain as a corollary characterizing those collection of natural transformations with two distinguished arguments that define posystems on the class $\text{AlgSys}^*(\mathcal{I})$, i.e., on the algebraic system reducts of the reduced matrix families of a π -institution $\mathcal{I}$.

Corollary 1864 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b having two distinguished arguments, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\beta^{\mathcal{A}}(T)$ is a posystem on $\mathcal{A}$ if and only if the following conditions hold, for all σ^b in N^b , $\Sigma \in |\mathbf{Sign}^b|$, $\phi, \psi, \chi, \vec{\chi} \in \text{SEN}^b(\Sigma)$:*

1. $\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I});$
2. $\beta_\Sigma[\phi, \chi] \leq C(\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \chi]);$
3. $\sigma_\Sigma^b(\psi, \vec{\chi}) \in C_\Sigma(\vec{\beta}_\Sigma[\phi, \psi], \sigma^b(\phi, \vec{\chi})).$

Proof: Suppose that, for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\beta^{\mathcal{A}}(T)$ is a posystem on $\mathcal{A}$. Then, by Theorem 1863, Conditions 1 and 3 hold. By considering all reduced matrix families $\langle / \Omega(T), T / \Omega(T) \rangle$, with $t \in \text{ThFam}(\mathcal{I})$, we get, by the transitivity of $\beta^{\mathcal{F}/\Omega(T)}(T / \Omega(T))$, $\beta_\Sigma^{\mathcal{F}/\Omega(T)}[\phi / \Omega_\Sigma(T), \psi / \Omega_\Sigma(T)] \leq T / \Omega(T)$ and $\beta_\Sigma^{\mathcal{F}/\Omega(T)}[\psi / \Omega_\Sigma(T), \chi / \Omega_\Sigma(T)] \leq T / \Omega(T)$ imply $\beta_\Sigma^{\mathcal{F}/\Omega(T)}[\phi / \Omega_\Sigma(T), \chi / \Omega_\Sigma(T)] \leq T / \Omega(T)$, i.e., $\beta_\Sigma[\phi, \psi] \leq T$ and $\beta_\Sigma[\psi, \chi] \leq T$ imply $\beta_\Sigma[\phi, \chi] \leq T$. This proves that $\beta_\Sigma[\phi, \chi] \leq C(\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \chi])$, i.e., that Condition 2 also holds.

Conversely, suppose Conditions 1-3 hold and let $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$. Then, by Theorem 1863, the relation system $\beta^{\mathcal{A}}(T)$ is reflexive and anti-symmetric. But, by Condition 2 of the hypothesis, it is also transitive and, therefore, it is a posystem on $\mathcal{A}$. $\blacksquare$

Given a π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$, we term any collection $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$, with two distinguished arguments, that satisfies 1-3 of Corollary 1864 a **semi-equivalence system for $\mathcal{I}$** .

Now we are in a position to provide a characterization of syntactic order algebraizability.

Theorem 1865 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) $\mathcal{I}$ is syntactically order algebraizable;
- (ii) *There exists $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b having two distinguished arguments and $\alpha : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ with a single distinguished argument, such that, for all σ^b in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi, \vec{\chi} \in \text{SEN}^b(\Sigma)$,*
 - $\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I});$
 - $\beta_\Sigma[\phi, \chi] \leq C(\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \chi]);$
 - $\beta_\Sigma[\sigma_\Sigma^b(\psi, \vec{\chi}), \tau_\Sigma^b(\psi, \vec{\chi})] \leq C(\vec{\beta}_\Sigma[\phi, \psi], \beta_\Sigma[\sigma_\Sigma^b(\phi, \vec{\chi}), \tau_\Sigma^b(\phi, \vec{\chi})]);$
 - $C(\phi) = C(\beta[\alpha_\Sigma[\phi]]);$
- (iii) $\mathcal{I}$ has a semi-equivalence system β and there exists $\alpha : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b with a single distinguished argument, such that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$, $C(\phi) = C(\beta[\alpha_\Sigma[\phi]])$.

If any of Conditions (i)-(iii) holds, then $\mathcal{I}$ is β -order algebraizable, with β in N^b any collection satisfying Condition (ii) or (iii).

Proof:

(i) $\Rightarrow$ (ii) Suppose $\mathcal{I}$ is syntactically order algebraizable. Then, by definition, it is equivalent to the inequational π -institution $\mathcal{I}^{\mathbf{K}, \leq} = \langle \mathbf{F}, C^{\mathbf{K}, \leq} \rangle$ associated with some class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems, via a conjugate pair $(\alpha, \beta) : \mathcal{I} \not\rightleftharpoons \mathcal{I}^{\mathbf{K}, \leq}$. Let σ^b in N^b , $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi, \chi, \vec{\chi} \in \text{SEN}^b(\Sigma)$.

- We have, by Lemma 1848, $\phi \leq \phi \in C_{\Sigma}^{\mathbf{K}, \leq}(\emptyset)$. Thus, we get $\beta_{\Sigma}[\phi, \phi] \leq C(\emptyset)$.
- Similarly, by Lemma 1848, $\phi \leq \chi \in C_{\Sigma}^{\mathbf{K}, \leq}(\phi \leq \psi, \psi \leq \chi)$. Therefore, $\beta_{\Sigma}[\phi, \chi] \leq C(\beta_{\Sigma}[\phi, \psi], \beta_{\Sigma}[\psi, \chi])$.
- Since $\mathbf{K}$ is a class of $\mathbf{F}$ -algebraic posystems, we have

$$\sigma_{\Sigma}^b(\psi, \vec{\chi}) \leq \tau_{\Sigma}^b(\psi, \vec{\chi}) \in C_{\Sigma}^{\mathbf{K}, \leq}(\phi \leq \psi, \psi \leq \phi, \sigma_{\Sigma}^b(\phi, \vec{\chi}) \leq \tau_{\Sigma}^b(\phi, \vec{\chi})).$$

From this, we get

$$\beta_{\Sigma}[\sigma_{\Sigma}^b(\psi, \vec{\chi}), \tau_{\Sigma}^b(\psi, \vec{\chi})] \leq C(\vec{\beta}_{\Sigma}[\phi, \psi], \beta_{\Sigma}[\sigma_{\Sigma}^b(\phi, \vec{\chi}), \tau_{\Sigma}^b(\phi, \vec{\chi})]).$$

- $C(\phi) = C(\beta[\alpha_{\Sigma}[\phi]])$ holds by the definition of equivalence.

(ii) $\Rightarrow$ (iii) Assume that $\alpha : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2$ with one distinguished argument and $\beta : (\text{SEN}^b)^{\omega} \rightarrow \text{SEN}^b$ with two distinguished arguments satisfy the Conditions in (ii). According to the definition of a semi-equivalence system, it suffices to show that, for all σ^b in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \vec{\chi} \in \text{SEN}^b(\Sigma)$,

$$\sigma_{\Sigma}^b(\psi, \vec{\chi}) \in C_{\Sigma}(\vec{\beta}_{\Sigma}[\phi, \psi], \sigma_{\Sigma}^b(\phi, \vec{\chi})).$$

By the last condition in the hypothesis, we have

$$\beta[\alpha_{\Sigma}[\sigma_{\Sigma}^b(\phi, \vec{\chi})]] \leq C(\sigma_{\Sigma}^b(\phi, \vec{\chi})).$$

By the third condition in the hypothesis, we get

$$\beta[\alpha_{\Sigma}[\sigma_{\Sigma}^b(\psi, \vec{\chi})]] \leq C(\vec{\beta}_{\Sigma}[\phi, \psi], \beta[\alpha_{\Sigma}[\sigma_{\Sigma}^b(\phi, \vec{\chi})]]).$$

Again, using the last condition in the hypothesis, we get

$$\sigma_{\Sigma}^b(\psi, \vec{\chi}) \in C_{\Sigma}(\beta[\alpha_{\Sigma}[\sigma_{\Sigma}^b(\psi, \vec{\chi})]]).$$

Combining these, we get $\sigma_{\Sigma}^b(\psi, \vec{\chi}) \in C_{\Sigma}(\vec{\beta}_{\Sigma}[\phi, \psi], \sigma_{\Sigma}^b(\phi, \vec{\chi}))$.

(iii) $\Rightarrow$ (i) Suppose $\beta : (\text{SEN}^b)^{\omega} \rightarrow \text{SEN}^b$ in N^b , with two distinguished arguments, is a semi-equivalence system for $\mathcal{I}$ and $\alpha : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2$ in N^b satisfies the condition in (iii). We have to construct a class of

$\mathbf{F}$ -algebraic posystems that will serve as the basis for the syntactic order algebraization of $\mathcal{I}$. Consider $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$. Define on $\mathcal{A}$, $\leq^{\mathcal{A}, T} = \{\leq_{\Sigma}^{\mathcal{A}, T}\}_{\Sigma \in |\mathbf{Sign}|}$ by setting, for all $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\phi \leq_{\Sigma}^{\mathcal{A}, T} \psi \quad \text{iff} \quad \beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T.$$

By Corollary 1864, $\leq^{\mathcal{A}, T}$ is a posystem on $\mathcal{A}$. Set

$$\mathbf{K} = \{\langle \mathcal{A}, \leq^{\mathcal{A}, T} \rangle : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}.$$

It now suffices to show that $\mathcal{I}$ is equivalent to $\mathcal{I}^{\mathbf{K}, \leq}$ via the conjugate pair $(\alpha, \beta) : \mathcal{I} \rightleftarrows \mathcal{I}^{\mathbf{K}, \leq}$. One of the two requirements demanded by Proposition 901 is fulfilled by the hypothesis. It suffices, therefore, to show that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $I \cup \{\phi \leq \psi\} \subseteq \text{In}_{\Sigma}(\mathbf{F})$,

$$\phi \leq \psi \in C_{\Sigma}^{\mathbf{K}, \leq}(I) \quad \text{iff} \quad \beta_{\Sigma}[\phi, \psi] \leq C(\beta_{\Sigma}[I]).$$

We have $\phi \leq \psi \in C_{\Sigma}^{\mathbf{K}, \leq}(I)$ if and only if, for all $\langle \mathcal{A}, \leq^{\mathcal{A}, T} \rangle \in \mathbf{K}$, $\Sigma' \in |\mathbf{Sign}^b|$, $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\begin{aligned} \alpha_{\Sigma'}(\text{SEN}^b(f)(I)) &\subseteq \leq_{F(\Sigma')}^{\mathcal{A}, T} \\ \text{implies} \quad \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) &\leq_{F(\Sigma')}^{\mathcal{A}, T} \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi)) \end{aligned}$$

if and only if, for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\begin{aligned} \beta[\alpha_{\Sigma'}(\text{SEN}^b(f)(I))] &\leq T \\ \text{implies} \quad \beta[\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)), \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi))] &\leq T \end{aligned}$$

if and only if, for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\begin{aligned} \alpha(\beta_{\Sigma'}[\text{SEN}^b(f)(I)]) &\leq T \\ \text{implies} \quad \alpha(\beta_{\Sigma'}[\text{SEN}^b(f)(\phi), \text{SEN}^b(f)(\psi)]) &\leq T \end{aligned}$$

iff, by the completeness of $\mathcal{I}$ with respect to $\text{MatFam}^*(\mathcal{I})$, $\beta_{\Sigma}[\phi, \psi] \leq C(\beta_{\Sigma}[I])$. ■

This characterization allows us to obtain several properties pertaining to syntactic order algebraizability.

Theorem 1866 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^{\omega} \rightarrow \text{SEN}^b$ in N^b , having two distinguished arguments, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a β -order algebraizable π -institution based on $\mathbf{F}$.*

(a) *For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$\Omega^{\mathcal{A}}(T) = \overset{\leftrightarrow}{\beta}^{\mathcal{A}}(T);$$

- (b) The β -order class of $\mathcal{I}$ is the semantic order quasivariety generated by $\mathbf{K} = \{\langle \mathcal{A}, \leq^{\mathcal{A}, T} \rangle : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}$, where, for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\phi \leq_{\Sigma}^{\mathcal{A}, T} \psi \quad \text{iff} \quad \beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T;$$

- (c) For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, the mapping $T \mapsto \beta^{\mathcal{A}}(T)$ is injective on $\text{FiFam}^{\mathcal{I}}(\mathcal{A})$.

Proof:

- (a) The conclusion follows from Theorems 1865 and 1863.
- (b) This also follows from Theorem 1865.
- (c) Suppose $\alpha : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2$ in N^b , having one distinguished argument, be as in Theorem 1865 and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}|$ and $\phi \in \text{SEN}(\Sigma)$. Then we have

$$\begin{aligned} \phi \in T_{\Sigma} & \quad \text{iff} \quad \beta^{\mathcal{A}}[\alpha_{\Sigma}^{\mathcal{A}}[\phi]] \leq T \\ & \quad \text{iff} \quad \alpha_{\Sigma}^{\mathcal{A}}[\phi] \leq \beta^{\mathcal{A}}(T), \end{aligned}$$

and, similarly, $\phi \in T'_{\Sigma}$ if and only if $\alpha_{\Sigma}^{\mathcal{A}}[\phi] \leq \beta^{\mathcal{A}}(T')$. We conclude that, if $\beta^{\mathcal{A}}(T) = \beta^{\mathcal{A}}(T')$, then $T = T'$ and, hence, $T \mapsto \beta^{\mathcal{A}}(T)$ is injective. $\blacksquare$

We can now establish some connections between syntactic order algebraizability and syntactic protoalgebraicity.

Proposition 1867 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.*

- (a) $\mathcal{I}$ has a semi-equivalence system if and only if it is syntactically protoalgebraic;
- (b) If $\mathcal{I}$ is syntactically order algebraizable, then it is syntactically protoalgebraic;
- (c) If $I^b : (\text{SEN}^b)^{\omega} \rightarrow \text{SEN}^b$ in N^b , with two distinguished arguments, witnesses the syntactic protoalgebraicity of $\mathcal{I}$ and $\mathcal{I}$ is β -order algebraizable, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$C(I_{\Sigma}^{\leftrightarrow b}[\phi, \psi]) = C(\vec{\beta}_{\Sigma}[\phi, \psi]).$$

Proof:

- (a) $\mathcal{I}$ has a semi-equivalence system if and only if, by Corollary 1864, for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\beta^{\mathcal{A}}(T)$ is a posystem on $\mathcal{A}$, implies that, for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\beta^{\mathcal{A}}(T)$ is reflexive and antisymmetric, if and only if, by Theorem 1863, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Omega^{\mathcal{A}}(T) = \overrightarrow{\beta}^{\mathcal{A}}(T)$, if and only if $\mathcal{I}$ is syntactically protoalgebraic.

On the other hand, if $\mathcal{I}$ is syntactically protoalgebraic, with witnessing transformations $I^b : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$, having two distinguished arguments, then, for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\overleftrightarrow{I}^{\mathcal{A}}(T) = \Omega^{\mathcal{A}}(T) = \Delta^{\mathcal{A}}$, whence for all $\langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})$, $\overleftrightarrow{I}^{\mathcal{A}}(T)$ is a posystem on $\mathcal{A}$ and, hence, by Corollary 1864, $\overleftrightarrow{I}^b$ is a semi-equivalence system for $\mathcal{I}$.

- (b) By Part (a) of Theorem 1866.
- (c) This follows from the fact that, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $\overleftrightarrow{I}_\Sigma[\phi, \psi] \leq T$ if and only if $\langle \phi, \psi \rangle \in \Omega(T)$ if and only if $\overleftrightarrow{\beta}_\Sigma[\phi, \psi] \leq T$. ■

Theorem 1867 reveals two important properties. First, that syntactic order algebraizability implies syntactic protoalgebraicity and, second, that the latter is equivalent to the existence of a semi-equivalence system for $\mathcal{I}$. Recall that syntactic protoalgebraicity is one component in syntactic WF algebraizability. We turn now to investigating how far syntactic WF algebraizability is from syntactic order algebraizability.

Theorem 1868 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b , having two distinguished arguments, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a β -order algebraizable π -institution, based on $\mathbf{F}$, and $\mathbf{K}$ the β -order class of $\mathcal{I}$. Then, the following conditions are equivalent:*

- (i) $\mathcal{I}$ is syntactically WF algebraizable;
- (ii) There exists $\gamma : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , with two distinguished arguments, such that, for all $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \in \mathbf{K}$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\phi \leq_\Sigma^{\mathcal{A}} \psi \quad \text{iff} \quad \gamma_\Sigma^{\mathcal{A}}[\phi, \psi] \leq \Delta^{\mathcal{A}};$$

- (iii) There exists $\gamma : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , with two distinguished arguments, such that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$C(\beta_\Sigma[\phi, \psi]) = C(\overleftrightarrow{\beta}[\gamma_\Sigma[\phi, \psi]]);$$

- (iv) $\mathcal{I}$ is $S^{\mathcal{I}}$ -fortified and for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\Omega^{\mathcal{A}}$ is injective on $\text{FiFam}^{\mathcal{I}}(\mathcal{A})$;

(v) $\mathcal{I}$ is $S^\mathcal{I}$ -fortified and Ω is injective on $\text{ThFam}(\mathcal{I})$.

Proof:

- (iv) $\Leftrightarrow$ (v) We know that injectivity of the Leibniz operator transfers from Theory families to all filter families over arbitrary algebraic systems.
- (i) $\Leftrightarrow$ (iv) If $\mathcal{I}$ is syntactically WF algebraizable, then it is $R^\mathcal{I}S^\mathcal{I}$ -fortified, protoalgebraic and family injective. Suppose, conversely, that $\mathcal{I}$ is $S^\mathcal{I}$ -fortified and family injective. This implies that $\mathcal{I}$ is family truth equational. Together with the syntactic protoalgebraicity following from the hypothesis and Proposition 1867, we get that $\mathcal{I}$ is syntactically WF algebraizable.
- (ii) $\Leftrightarrow$ (iii) Let $\gamma : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$ in N^b , with two distinguished arguments. Suppose, first, that, for all $\langle \mathcal{A}, \leq^{\mathcal{A}} \rangle \in \mathbf{K}$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$, $\phi \leq_\Sigma^{\mathcal{A}} \psi$ iff $\gamma_\Sigma^{\mathcal{A}}[\phi, \psi] \leq \Delta^{\mathcal{A}}$. Then, we have, for all $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$\beta_\Sigma[\phi, \psi] \leq T \quad \text{iff} \quad \vec{\beta}[\gamma_\Sigma[\phi, \psi]] \leq T,$$

which yields the conclusion. Conversely, if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $C(\beta_\Sigma[\phi, \psi]) = C(\vec{\beta}[\gamma_\Sigma[\phi, \psi]])$, then, we get

$$C^{K, \leq}(\alpha[\beta_\Sigma[\phi, \psi]]) = C^{K, \leq}(\alpha[\vec{\beta}[\gamma_\Sigma[\phi, \psi]]]).$$

Thus, $C^{K, \leq}(\phi \leq \psi) = C^{K, \leq}(\gamma_\Sigma[\phi, \psi] \cup \gamma_\Sigma[\phi, \psi]^{-1})$. This yields the conclusion if we take into account that $\mathbf{K}$ consists of $\mathbf{F}$ -algebraic posystems.

- (i) $\Rightarrow$ (ii) Suppose that $\mathcal{I}$ is syntactically WF algebraizable via the conjugate pair $(\tau, I) : \mathcal{I} \rightleftarrows \mathcal{Q}^{\text{AlgSys}^*(\mathcal{I})}$. Then, by Proposition 1867, we get that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $C(\vec{I}_\Sigma^b[\phi, \psi]) = C(\vec{\beta}_\Sigma^b[\phi, \psi])$. Thus, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$, $C(\phi) = C(\vec{I}^b[\tau_\Sigma^b[\phi]]) = C(\vec{\beta}[\tau_\Sigma^b[\phi]])$. Therefore, in particular, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$C(\beta_\Sigma[\phi, \psi]) = C(\vec{\beta}[\tau^b[\beta_\Sigma[\phi, \psi]]]).$$

Now consider any $\langle \mathcal{A}, \leq^{\mathcal{A}, T} \rangle$, where $T \in \text{FiFam}^\mathcal{I}(\mathcal{A})$ is such that $\Omega^{\mathcal{A}}(T) = \Delta^{\mathcal{A}}$. Then, we get, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\begin{aligned} \phi \leq_\Sigma^{\mathcal{A}, T} \psi & \quad \text{iff} \quad \beta_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T \\ & \quad \text{iff} \quad \vec{\beta}^{\mathcal{A}}[\tau^{\mathcal{A}}[\beta_\Sigma^{\mathcal{A}}[\phi, \psi]]] \leq T \\ & \quad \text{iff} \quad \tau^{\mathcal{A}}[\beta_\Sigma^{\mathcal{A}}[\phi, \psi]] \leq \Delta^{\mathcal{A}}. \end{aligned}$$

Thus, taking into account the fact that $\mathbf{K}$ is the semantic order quasi-variety generated by the class $\{\langle \mathcal{A}, \leq^{\mathcal{A}, T} \rangle : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}$, we conclude that $\gamma := \tau \circ \beta$ is witnessing the property asserted in Part (ii).

(iii) $\Rightarrow$ (v) Finally, assume $(\alpha, \beta) : \mathcal{I} \rightleftarrows \mathcal{I}^{\mathbf{K}, \leq}$ witnesses the β -order algebraizability of $\mathcal{I}$ and that $\gamma : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$, with two distinguished arguments satisfies the property in Condition (iii). Let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{SEN}^b(\Sigma)$. Then, we have

$$\begin{aligned} \phi \in T_\Sigma & \text{ iff } \beta[\alpha_\Sigma[\phi]] \leq T \\ & \text{ iff } \vec{\beta}[\gamma[\alpha_\Sigma[\phi]]] \leq T \\ & \text{ iff } \gamma[\alpha_\Sigma[\phi]] \leq \Omega^{\mathcal{A}}(T). \end{aligned}$$

This shows that $\mathcal{I}$ is truth equational, which implies that it is $S^{\mathcal{I}}$ -fortified and family injective. ■

25.3 Polarities

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system. A **polarity for $\mathbf{F}$** is a pair $M = (M^+, M^-)$, where M^+ and M^- are subsets of N^b .

The intuition behind the definition is that

- if $\sigma^b \in M^+$, then it is monotone in the first argument and
- if $\sigma^b \in M^-$, then it is antimonotone in the first argument.

Why only referring to the first argument? The reason is that it suffices to refer to the first argument to cover all arguments. Suppose, e.g., that $\sigma^b : (\text{SEN}^b)^2 \rightarrow \text{SEN}^b$ is in N^b . Then $\sigma^b \circ \langle p^{2,1}, p^{2,0} \rangle$ is also in N^b . If we denote σ^b informally by $\sigma^b(x, y)$, then we may denote $\sigma^b \circ \langle p^{2,1}, p^{2,0} \rangle$ by $\sigma^b(y, x)$. Since both transformations are in N^b , if we wanted to declare that σ^b is, say, antimonotone in the second argument, then we would assign $\sigma^b(y, x)$ in M^- , getting away with referring only to the first argument of some natural transformation in N^b . The same trick may be used for any argument position and, hence, the expression “ σ^b **has positive** (or **negative polarity**) **in the k -th argument**” should come as no surprise, even though the formal assignment is done only by classifying leading arguments.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b , with two distinguished arguments, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Define the **polarity $B = (B^+, B^-)$ induced by β** (the letter B here is chosen to correspond to the transformation β) by setting, for all σ^b in N^b :

(+) $\sigma^b \in B^+$ if and only if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \vec{\chi} \in \text{SEN}^b(\Sigma)$,

$$\sigma_\Sigma^b(\psi, \vec{\chi}) \in C_\Sigma(\beta_\Sigma[\phi, \psi], \sigma_\Sigma^b(\phi, \vec{\chi}));$$

(−) $\sigma^b \in B^-$ if and only if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \vec{\chi} \in \text{SEN}^b(\Sigma)$,

$$\sigma_\Sigma^b(\phi, \vec{\chi}) \in C_\Sigma(\beta_\Sigma[\phi, \psi], \sigma_\Sigma^b(\psi, \vec{\chi})).$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system, $\leq$ a relation system on $\mathcal{A}$ and $T \in \text{SenFam}(\mathcal{A})$. We say that $\leq$ is M -compatible with T if, for all σ^b in N^b , $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi, \tilde{\chi} \in \text{SEN}(\Sigma)$,

- if $\sigma^b \in M^+$, $\phi \leq_\Sigma \psi$, then $\sigma_\Sigma^A(\phi, \tilde{\chi}) \in T_\Sigma$ imply $\sigma_\Sigma^A(\psi, \tilde{\chi}) \in T_\Sigma$;
- if $\sigma^b \in M^-$, $\phi \leq_\Sigma \psi$, then $\sigma_\Sigma^A(\psi, \tilde{\chi}) \in T_\Sigma$ imply $\sigma_\Sigma^A(\phi, \tilde{\chi}) \in T_\Sigma$.

Proposition 1869 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \text{SenFam}(\mathcal{A})$, there exists a largest qosystem on $\mathcal{A}$ that is M -compatible with T .*

Proof: We consider the class $\text{QoSys}^{\mathcal{A}}(T)$ of all qosystems on $\mathcal{A}$ that are M -compatible with T . We take the transitive closure of the union of all qosystems in $\text{QoSys}^{\mathcal{A}}(T)$,

$$\text{tc}(\bigcup \text{QoSys}^{\mathcal{A}}(T)) = \{\text{tc}_\Sigma(\bigcup \text{QoSys}^{\mathcal{A}}(T))\}_{\Sigma \in |\mathbf{Sign}|}.$$

It suffices to show that this is also a qosystem on $\mathcal{A}$ M -compatible with T , i.e., it is itself a member of $\text{QoSys}^{\mathcal{A}}(T)$. It will then follow that it is its largest member. It is clear by the definition that $\text{tr}(\bigcup \text{QoSys}^{\mathcal{A}}(T))$ is a qosystem on $\mathcal{A}$. So it suffices to show that it is M -compatible with T . Suppose σ^b in M^+ , $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi, \tilde{\chi} \in \text{SEN}(\Sigma)$, such that $\phi \text{ tr}_\Sigma(\bigcup \text{QoSys}^{\mathcal{A}}(T)) \psi$ and $\sigma_\Sigma^b(\phi, \tilde{\chi}) \in T_\Sigma$. Then, there exist $q^0, \dots, q^k \in \text{QoSys}^{\mathcal{A}}(T)$ and $\xi_1, \dots, \xi_k \in \text{SEN}(\Sigma)$, such that

$$\phi \ q_\Sigma^0 \ \xi_1 \ q_\Sigma^1 \ \xi_2 \ q_\Sigma^2 \ \cdots \ q_\Sigma^{k-1} \ \xi_k \ q_\Sigma^k \ \psi.$$

Since $\phi \ q_\Sigma^0 \ \xi_1$ and $\sigma_\Sigma^b(\phi, \tilde{\chi}) \in T_\Sigma$, we get $\sigma_\Sigma^b(\xi_1, \tilde{\chi}) \in T_\Sigma$. Similarly, since $\xi_1 \ q_\Sigma^1 \ \xi_2$ and $\sigma_\Sigma^b(\xi_1, \tilde{\chi}) \in T_\Sigma$, we get $\sigma_\Sigma^b(\xi_2, \tilde{\chi}) \in T_\Sigma$. We move one step to the right at a time in a similar fashion until we obtain $\sigma_\Sigma^b(\psi, \tilde{\chi}) \in T_\Sigma$. A similar argument is used to handle the case of negative polarity for σ^b . This proves that $\text{tr}(\bigcup \text{QoSys}^{\mathcal{A}}(T)) \in \text{QoSys}^{\mathcal{A}}(T)$ and, therefore, that it is its largest member. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{SenFam}(\mathcal{A})$. The M -Leibniz order of T on $\mathcal{A}$ is the largest qosystem $\leq^{M, \mathcal{A}}(T)$ on $\mathcal{A}$ that is M -compatible with T .

The next theorem provides a characterization of the M -Leibniz order of a sentence family.

Theorem 1870 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ be a polarity for $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $T \in \text{SenFam}(\mathcal{A})$. For all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$, $\phi \leq_\Sigma^{M, \mathcal{A}}(T) \psi$ if and only if, for all σ^b in N^b , $\Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$, $\tilde{\chi} \in \text{SEN}(\Sigma')$,*

- $\sigma^b \in M^+$ and $\sigma_{\Sigma'}^A(\text{SEN}(f)(\phi), \tilde{\chi}) \in T_{\Sigma'}$ imply $\sigma_{\Sigma'}^A(\text{SEN}(f)(\psi), \tilde{\chi}) \in T_{\Sigma'}$;
- $\sigma^b \in M^-$ and $\sigma_{\Sigma'}^A(\text{SEN}(f)(\psi), \tilde{\chi}) \in T_{\Sigma'}$ imply $\sigma_{\Sigma'}^A(\text{SEN}(f)(\phi), \tilde{\chi}) \in T_{\Sigma'}$.

Proof: We let $\preceq^A = \{\preceq_{\Sigma}^A\}_{\Sigma \in |\mathbf{Sign}|}$ be defined by setting, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$, $\phi \preceq_{\Sigma}^A \psi$ if and only if, for all σ^b in N^b , $\Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$, $\tilde{\chi} \in \text{SEN}(\Sigma')$,

- $\sigma^b \in M^+$ and $\sigma_{\Sigma'}^A(\text{SEN}(f)(\phi), \tilde{\chi}) \in T_{\Sigma'}$ imply $\sigma_{\Sigma'}^A(\text{SEN}(f)(\psi), \tilde{\chi}) \in T_{\Sigma'}$;
- $\sigma^b \in M^-$ and $\sigma_{\Sigma'}^A(\text{SEN}(f)(\psi), \tilde{\chi}) \in T_{\Sigma'}$ imply $\sigma_{\Sigma'}^A(\text{SEN}(f)(\phi), \tilde{\chi}) \in T_{\Sigma'}$.

Then it is clear that $\preceq^A$ is a qosystem on $\mathcal{A}$. Moreover, by its definition, it is compatible with T . Hence, by the maximality of the M -Leibniz order of T on $\mathcal{A}$, $\preceq^A \leq \preceq^{M, \mathcal{A}}(T)$. On the other hand, if $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\phi \preceq_{\Sigma}^{M, \mathcal{A}}(T) \psi$, then, since $\preceq^{M, \mathcal{A}}(T)$ is a qosystem, we get for all $\Sigma' \in |\mathbf{Sign}|$ and $f \in \mathbf{Sign}(\Sigma, \Sigma')$, $\text{SEN}^b(f)(\phi) \preceq_{\Sigma'}^{M, \mathcal{A}}(T) \text{SEN}^b(f)(\psi)$. Thus, since $\preceq^{M, \mathcal{A}}(T)$ is M -compatible with T , we get $\phi \preceq_{\Sigma}^A \psi$. Therefore, $\preceq^{M, \mathcal{A}}(T) \leq \preceq^A$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The pair $\langle \mathcal{I}, M \rangle$ is called a **polar π -institution**.

Given an $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, the qosystem $\preceq^{M, \mathcal{A}}(T)$ is called the **M -Leibniz order of T on $\mathcal{A}$** . The collection of maps

$$T \mapsto \preceq^{M, \mathcal{A}}(T), \quad T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}),$$

for all $\mathcal{A}$, constitute the **M -Leibniz order operator $\preceq^M$** .

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system. We denote by $O = (O^+, O^-)$ the **total polarity for $\mathbf{F}$** , i.e., the polarity consisting of

$$O^+ = O^- = N^b.$$

Corollary 1871 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $O = (O^+, O^-)$ the total polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The O -Leibniz order operator $\preceq^O$ of $\mathcal{I}$ coincides with the Leibniz operator Ω of $\mathcal{I}$.*

Proof: This follows directly from the definition of O , Theorem 1870 and Theorem 19. ■

Next we give two properties of the operator $\preceq^M$. The first is commutativity with inverse surjective morphisms and the second is a characterization of monotonicity. Both properties take after similar properties of the Leibniz operator that were established in previous chapters.

Lemma 1872 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For all $\mathbf{F}$ -algebraic systems $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$, all surjective morphisms $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{B})$,*

$$\gamma^{-1}(\preceq^{M, \mathcal{B}}(T)) = \preceq^{M, \mathcal{A}}(\gamma^{-1}(T)).$$

Proof: Let $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$. We have $\phi \leq_{\Sigma}^{M, \mathcal{A}} (\gamma^{-1}(T)\psi)$ if and only if, for all σ^b in N^b , all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\tilde{\chi} \in \text{SEN}(\Sigma')$,

- if $\sigma^b \in M^+$, then $\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\phi), \tilde{\chi}) \in \gamma_{\Sigma'}^{-1}(T_{H(\Sigma')})$ implies $\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\psi), \tilde{\chi}) \in \gamma_{\Sigma'}^{-1}(T_{H(\Sigma')})$;
- if $\sigma^b \in M^-$, then $\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\psi), \tilde{\chi}) \in \gamma_{\Sigma'}^{-1}(T_{H(\Sigma')})$ implies $\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\phi), \tilde{\chi}) \in \gamma_{\Sigma'}^{-1}(T_{H(\Sigma')})$;

if and only if for all σ^b in N^b , all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\tilde{\chi} \in \text{SEN}(\Sigma')$,

- if $\sigma^b \in M^+$, then $\gamma_{\Sigma'}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\phi), \tilde{\chi})) \in T_{H(\Sigma')}$ implies $\gamma_{\Sigma'}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\psi), \tilde{\chi})) \in T_{H(\Sigma')}$;
- if $\sigma^b \in M^-$, then $\gamma_{\Sigma'}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\psi), \tilde{\chi})) \in T_{H(\Sigma')}$ implies $\gamma_{\Sigma'}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}(f)(\phi), \tilde{\chi})) \in T_{H(\Sigma')}$;

if and only if for all σ^b in N^b , all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\tilde{\chi} \in \text{SEN}(\Sigma')$,

- if $\sigma^b \in M^+$, then $\sigma_{H(\Sigma')}^{\mathcal{B}}(\text{SEN}'(H(f))(\gamma_{\Sigma}(\phi)), \gamma_{\Sigma'}(\tilde{\chi})) \in T_{H(\Sigma')}$ implies $\sigma_{H(\Sigma')}^{\mathcal{B}}(\text{SEN}'(H(f))(\gamma_{\Sigma}(\psi)), \gamma_{\Sigma'}(\tilde{\chi})) \in T_{H(\Sigma')}$;
- if $\sigma^b \in M^-$, then $\sigma_{H(\Sigma')}^{\mathcal{B}}(\text{SEN}'(H(f))(\gamma_{\Sigma}(\psi)), \gamma_{\Sigma'}(\tilde{\chi})) \in T_{H(\Sigma')}$ implies $\sigma_{H(\Sigma')}^{\mathcal{B}}(\text{SEN}'(H(f))(\gamma_{\Sigma}(\phi)), \gamma_{\Sigma'}(\tilde{\chi})) \in T_{H(\Sigma')}$;

if and only, by the surjectivity of $\langle H, \gamma \rangle$, $\gamma_{\Sigma}(\phi) \leq_{H(\Sigma)}^{M, \mathcal{B}} \gamma_{\Sigma}(\psi)$ if and only if $\phi \gamma_{\Sigma}^{-1}(\leq_{H(\Sigma)}^{M, \mathcal{B}}(T))\psi$. ■

Lemma 1873 Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic systems $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\leq^{M, \mathcal{A}}$ is monotone if and only if it commutes with arbitrary intersections.

Proof: Suppose, first, that $\leq^{M, \mathcal{A}}$ is monotone and let $\mathcal{T} \subseteq \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, by monotonicity, $\leq^{M, \mathcal{A}}(\cap_{T \in \mathcal{T}} T) \leq \cap_{T \in \mathcal{T}} \leq^{M, \mathcal{A}}(T)$. On the other hand, $\cap_{T \in \mathcal{T}} \leq^{M, \mathcal{A}}(T)$ is a qosystem on $\mathcal{A}$, which can be easily seen to be M -compatible with $\cap \mathcal{T}$. Thus, by the maximality property of $\leq^{M, \mathcal{A}}(\cap \mathcal{T})$, we get $\cap_{T \in \mathcal{T}} \leq^{M, \mathcal{A}}(T) \leq \leq^{M, \mathcal{A}}(\cap_{T \in \mathcal{T}} T)$. Therefore, the two qosystems are equal and $\leq^{M, \mathcal{A}}$ commutes with arbitrary intersections.

Suppose, conversely, $\leq^{M, \mathcal{A}}$ commutes with arbitrary intersections and let $T, T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $T \leq T'$. Then, we have

$$\leq^{M, \mathcal{A}}(T) = \leq^{M, \mathcal{A}}(T \cap T') = \leq^{M, \mathcal{A}}(T) \cap \leq^{M, \mathcal{A}}(T'),$$

whence, we get $\leq^{M, \mathcal{A}}(T) \leq \leq^{M, \mathcal{A}}(T')$ and, therefore, $\leq^{M, \mathcal{A}}$ is monotone. ■

25.4 Directional Systems

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The polar π -institution $\langle \mathcal{I}, M \rangle$ is called **directional** and the π -institution $\mathcal{I}$ is called **M -directional** if there exists $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b , with two distinguished arguments, such that, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi \quad \text{iff} \quad \beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T,$$

The collection β in N^b will be called a family of **witnessing transformations for the M -directionality of $\mathcal{I}$** .

Here are a couple of direct consequences of the definition. The first asserts that any two set of witnessing transformations for the M -directionality of a given π -institution are deductively equivalent. The second asserts that M -directionality is preserved under extensions.

Lemma 1874 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta, \beta' : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b , having two distinguished arguments, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -directional with witnessing transformations β and β' , then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,*

$$C(\beta_{\Sigma}[\phi, \psi]) = C(\beta'_{\Sigma}[\phi, \psi]).$$

Proof: We have, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\phi, \psi \in \text{SEN}^b(\Sigma)$ and all $T \in \text{ThFam}(\mathcal{I})$,

$$\begin{aligned} \beta_{\Sigma}[\phi, \psi] \leq T & \quad \text{iff} \quad \phi \leq_{\Sigma}^{M, \mathcal{F}}(T) \psi \\ & \quad \text{iff} \quad \beta'_{\Sigma}[\phi, \psi] \leq T. \end{aligned}$$

Therefore, $C(\beta_{\Sigma}[\phi, \psi]) = C(\beta'_{\Sigma}[\phi, \psi])$. ■

Lemma 1875 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b , having two distinguished arguments, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$, $\mathcal{I}' = \langle \mathbf{F}, C' \rangle$ two π -institutions based on $\mathbf{F}$. If $\mathcal{I}$ is M -directional with witnessing transformations β and $\mathcal{I} \leq \mathcal{I}'$, then $\mathcal{I}'$ is also M -directional with witnessing transformations β .*

Proof: Suppose $\mathcal{I}$ is M -directional with witnessing transformations β and $\mathcal{I} \leq \mathcal{I}'$. Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}'}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$. Then, since every $\mathcal{I}'$ -filter family of $\mathcal{A}$ is also an $\mathcal{I}$ -filter family, we have, by hypothesis, $\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi$ iff $\beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T$. We conclude that $\mathcal{I}'$ is also M -directional, with witnessing transformations β . ■

We give, next, sufficient conditions for the M -directionality of a given π -institution.

Theorem 1876 Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b having two distinguished arguments, and $M = (M^+, M^-)$ a polarity for $\mathbf{F}$, satisfying the following conditions:

1. $\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I})$, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$;
2. $M \leq B$, where $B = (B^+, B^-)$ is the polarity induced by β ;
3. For all $\sigma^b \in \beta$, $\sigma^b(x, y, \bar{z}) \in M^-$ or $\sigma^b(y, x, \bar{z}) \in M^+$.

Then $\mathcal{I}$ is M -directional, with witnessing transformations β .

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \mathbf{SEN}(\Sigma)$.

Suppose, first, that $\phi \leq_\Sigma^{M, \mathcal{A}}(T) \psi$ and $\sigma^b \in \beta$. Then, by Condition 3, either σ^b is of negative M -polarity in the first argument or of positive M -polarity in the second argument.

- Assume σ^b has negative polarity in the first argument. By Condition 1, we have $\sigma_\Sigma^{\mathcal{A}}[\psi, \psi] \leq T$. Therefore, by Condition 2 and the hypothesis, we get $\sigma_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$.
- Assume σ^b has positive polarity in the second argument. By Condition 1, we have $\sigma_\Sigma^{\mathcal{A}}[\phi, \phi] \leq T$. Therefore, by Condition 2 and the hypothesis, we get $\sigma_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$.

In either case $\sigma_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$, whence, $\beta_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$.

Assume, conversely, that $\beta_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$. Let σ^b in N^b , viewed as having one distinguished argument.

- If $\sigma^b \in M^+$, then, by Condition 2, $\sigma^b \in B^+$. Hence, by definition of B and the hypothesis, $\sigma_\Sigma^{\mathcal{A}}[\phi] \leq T$ implies $\sigma_\Sigma^{\mathcal{A}}[\psi] \leq T$.
- If $\sigma^b \in M^-$, then, by Condition 2, $\sigma^b \in B^-$. Hence, by definition of B and the hypothesis, $\sigma_\Sigma^{\mathcal{A}}[\psi] \leq T$ implies $\sigma_\Sigma^{\mathcal{A}}[\phi] \leq T$.

Therefore, by Theorem 1870, we conclude that $\phi \leq_\Sigma^{M, \mathcal{A}}(T) \psi$. Hence, $\mathcal{I}$ is M -directional with witnessing transformations β . ■

Now we look at some properties of M -directional π -institutions.

Theorem 1877 Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b having two distinguished arguments, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -directional, with witnessing transformations β , then the following properties hold:

- (a) For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi \in \mathbf{SEN}^b(\Sigma)$,

$$\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I}) \quad \text{and} \quad \beta_\Sigma[\phi, \chi] \leq C(\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \chi]);$$

(b) $M \leq B$, where B is the polarity for $\mathbf{F}$ induced by β ;

(c) For all $\sigma^b \in \beta$,

$$\sigma^b(x, y, \bar{z}) \in B^- \quad \text{and} \quad \sigma^b(y, x, \bar{z}) \in B^+;$$

(d) $\mathcal{I}$ is B -directional, with witnessing transformations β ;

(e) For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\preceq^{M, \mathcal{A}} = \preceq^{B, \mathcal{A}}$;

(f) B is the largest polarity M' for $\mathbf{F}$, such that $\preceq^{M'} = \preceq^M$.

Proof:

(a) Since $\preceq^M$ is a qosystem, it is reflexive and transitive. Thus, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$,

$$\begin{aligned} & \phi \preceq_{\Sigma}^{M, \mathcal{F}} (\text{Thm}(\mathcal{I})) \phi, \\ & \phi \preceq_{\Sigma}^{M, \mathcal{F}} (T) \psi \text{ and } \psi \preceq_{\Sigma}^{M, \mathcal{F}} (T) \chi \text{ imply } \phi \preceq_{\Sigma}^{M, \mathcal{F}} (T) \chi. \end{aligned}$$

Hence, by M -directionality, we get $\beta_{\Sigma}[\phi, \phi] \leq \text{Thm}(\mathcal{I})$ and

$$\beta_{\Sigma}[\phi, \psi] \leq T \text{ and } \beta_{\Sigma}[\psi, \chi] \leq T \text{ imply } \beta_{\Sigma}[\phi, \chi] \leq T.$$

The latter gives $\beta_{\Sigma}[\phi, \chi] \leq C(\beta_{\Sigma}[\phi, \psi], \beta_{\Sigma}[\psi, \chi])$.

(b) Suppose $\sigma^b \in M^+$ and let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi, \bar{\chi} \in \text{SEN}(\Sigma)$, such that

$$\beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T \quad \text{and} \quad \sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) \in T_{\Sigma}.$$

By M -directionality, we get $\phi \preceq_{\Sigma}^{M, \mathcal{A}} (T) \psi$ and $\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) \in T_{\Sigma}$. Thus, since $\sigma^b \in M^+$, we get $\sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi}) \in T_{\Sigma}$. We conclude that $\sigma^b \in B^+$ and, hence, $M^+ \subseteq B^+$. Similarly, we get that $M^- \subseteq B^-$ and, therefore, $M \leq B$.

(c) This follows directly by the second assertion of Part (a) and the definition of B .

(d) This follows from Parts (a), (c) and Theorem 1876.

(e) By the hypothesis and Part (d), we have, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\begin{aligned} \phi \preceq_{\Sigma}^{M, \mathcal{A}} (T) \psi & \text{ iff } \beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T \\ & \text{ iff } \phi \preceq_{\Sigma}^{B, \mathcal{A}} (T) \psi. \end{aligned}$$

Therefore, $\preceq^{M, \mathcal{A}} = \preceq^{B, \mathcal{A}}$.

- (f) We have that $\leq^{M'} = \leq^M$ if and only β witnesses the M' -directionality of $\mathcal{I}$. This implies, by Part (b), that $M' \leq B$. ■

We now obtain the following characterization of the existence of a polarity M for which $\mathcal{I}$ is M -directional with a predetermined set $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ of natural transformations in N^b as its witnessing set.

Corollary 1878 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b having two distinguished arguments, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) *There exists a polarity $M = (M^+, M^-)$ for $\mathbf{F}$, such that $\mathcal{I}$ is M -directional with witnessing transformations β ;*
- (ii) *For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$,*

$$\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I}) \quad \text{and} \quad \beta_\Sigma[\phi, \chi] \leq C(\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \chi]);$$

- (iii) *$\mathcal{I}$ is B -directional with witnessing transformations β .*

Proof: If Condition (i) holds, then Part (a) of Theorem 1877 ensures that Condition (ii) holds. If Condition (ii) holds, then, we get Part (c) of Theorem 1877 and, from Part (a) (our hypothesis) and Part (c) of Theorem 1877, we get, using Theorem 1876, Part (d) of Theorem 1877, which is Condition (iii). Finally, if (iii) holds, then B is a polarity on $\mathbf{F}$, such that $\mathcal{I}$ is B -directional, with witnessing transformations β and, thus, Condition (i) holds. ■

Our results allow us to show that families of collections of natural transformations in N^b with two distinguished arguments, satisfying Condition (ii) of Corollary 1878 and polarities on $\mathbf{F}$ are in correspondence under appropriate identifications of deductively equivalent collections of transformations and of polarities giving rise to the same Leibniz order operators.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$.

- Let $\mathfrak{B}(\mathcal{I})$ be the collection of all families $\beta : (\text{SEN}^b)^\omega \rightarrow \text{SEN}^b$ in N^b , with two distinguished arguments, such that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$,

$$\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I}) \quad \text{and} \quad \beta_\Sigma[\phi, \chi] \leq C(\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \chi]).$$

Moreover, we declare two collections $\beta, \beta' \in \mathfrak{B}(\mathcal{I})$ to be equivalent, written $\beta \equiv^{\mathcal{I}} \beta'$ if and only if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$C(\beta_\Sigma[\phi, \psi]) = C(\beta'_\Sigma[\phi, \psi]).$$

- Let $\mathfrak{M}(\mathcal{I})$ be the collection of all polarities for $\mathbf{F}$, such that $\mathcal{I}$ is M -directional.

Moreover, we declare two polarities M, M' in $\mathfrak{M}(\mathcal{I})$ to be equivalent, written $M \sim^{\mathcal{I}} M'$, if and only if $\leq^M = \leq^{M'}$.

Then we have the following correspondence.

Theorem 1879 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. There exists a bijection from $\mathcal{B}(\mathcal{I})/\equiv^{\mathcal{I}}$ onto $\mathfrak{M}(\mathcal{I})/\sim^{\mathcal{I}}$, such that*

$$\beta/\equiv^{\mathcal{I}} \mapsto B/\sim^{\mathcal{I}}, \quad \beta \in \mathfrak{B}(\mathcal{I}),$$

and such that every $\beta' \in \mathfrak{B}(\mathcal{I})$, such that $\beta' \equiv^{\mathcal{I}} \beta$, witnesses the M -directionality of $\mathcal{I}$, for all $M \in \mathfrak{M}(\mathcal{I})$, such that $M \sim^{\mathcal{I}} B$.

Proof: Let $\beta, \beta' \in \mathfrak{B}(\mathcal{I})$, such that $\beta \equiv^{\mathcal{I}} \beta'$. Then, for every $\mathbf{F}$ -algebraic system, all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$,

$$\begin{aligned} \phi \leq_{\Sigma}^{B, \mathcal{A}}(T) \psi & \text{ iff } \beta_{\Sigma}[\phi, \psi] \leq T \\ & \text{ iff } \beta'_{\Sigma}[\phi, \psi] \leq T \\ & \text{ iff } \phi \leq_{\Sigma}^{B', \mathcal{A}} \psi. \end{aligned}$$

Thus, $B \sim^{\mathcal{I}} B'$ and the mapping in the statement of the theorem is well-defined.

By definition of $\mathfrak{M}(\mathcal{I})$ and Theorem 1877, it is onto.

Finally, if $\beta, \beta' \in \mathfrak{B}(\mathcal{I})$, such that $B \sim^{\mathcal{I}} B'$, then, by definition, $\leq^B = \leq^{B'}$. Thus, for all $\langle \mathcal{A}, T \rangle \in \mathbf{MatFam}^*(\mathcal{I})$, we get, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$,

$$\begin{aligned} \beta_{\Sigma}[\phi, \psi] \leq T & \text{ iff } \phi \leq_{\Sigma}^{B, \mathcal{A}}(T) \psi \\ & \text{ iff } \phi \leq_{\Sigma}^{B', \mathcal{A}}(T) \psi \\ & \text{ iff } \beta'_{\Sigma}[\phi, \psi] \leq T. \end{aligned}$$

Therefore, by the completeness of $\mathcal{I}$ with respect to $\mathbf{MatFam}^*(\mathcal{I})$, we get that, for all $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$, $C(\beta_{\Sigma}[\phi, \psi]) = C(\beta'_{\Sigma}[\phi, \psi])$, i.e., $\beta \equiv^{\mathcal{I}} \beta'$ and, therefore, the map in the statement of the theorem is also injective. $\blacksquare$

Corollary 1880 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^{\omega} \rightarrow \mathbf{SEN}^b$ in N^b having two distinguished arguments, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If β is a semi-equivalence system for $\mathcal{I}$ (in particular, if $\mathcal{I}$ is β -order algebraizable), then $\mathcal{I}$ is B -directional, with witnessing transformations β .*

Proof: By Theorem 1865 and Corollary 1878. $\blacksquare$

25.5 Monotonicity and Directionality

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I}$ be a π -institution based on $\mathbf{F}$.

- We say that $\mathcal{I}$ is **M -order monotone** if the M -Leibniz order operator $\leq^M$ is monotone.
- We say that $\mathcal{I}$ is **M -directional** if there exists $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b , having two distinguished arguments, such that, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$,

$$\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi \quad \text{iff} \quad \beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T.$$

Our goal is to connect these two notions.

We have the following obvious relationship.

Theorem 1881 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I}$ be a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -directional, then $\mathcal{I}$ is M -order monotone.*

Proof: Suppose $\mathcal{I}$ is M -directional, with witnessing transformations β . Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T, T' \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, such that $T \leq T'$. Then, we get, by the M -directionality of $\mathcal{I}$, we get

$$\leq^{M, \mathcal{A}}(T) = \beta(T) \leq \beta(T') = \leq^{M, \mathcal{A}}(T').$$

Therefore, $\mathcal{I}$ is M -order monotone. ■

We introduce a collection of natural transformations associated with $\mathcal{I}$ that play in the present context a role analog to the role that the reflexive core $R^{\mathcal{I}}$ played in the case of syntactic protoalgebraicity. In fact the collection we introduce is a subcollection of the reflexive core of a π -institution $\mathcal{I}$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The M -**quasicore** $Q^{\mathcal{I}, M}$ of $\mathcal{I}$ is the collection

$$Q^{\mathcal{I}, M} = \{ \kappa^b \in N^b : \kappa^b(x, y, \tilde{z}) \in M^- \text{ and } \kappa^b(y, x, \tilde{z}) \in M^+ \text{ and } \\ (\forall \Sigma \in |\mathbf{Sign}^b|)(\forall \phi \in \mathbf{SEN}^b(\Sigma))(\kappa_{\Sigma}^b[\phi, \phi] \leq \text{Thm}(\mathcal{I})) \}.$$

It turns out that, if $\mathcal{I}$ is M -directional with witnessing transformations β , then $\beta \subseteq Q^{\mathcal{I}, M}$.

Lemma 1882 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b having two distinguished arguments, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -directional, with witnessing transformations β , then $\beta \subseteq Q^{\mathcal{I}, M}$.*

Proof: The conclusion follows directly from Parts (a) and (c) of Theorem 1877 and the definition of $Q^{\mathcal{I},M}$. $\blacksquare$

The M -directionality of a π -institution $\mathcal{I}$ guarantees that the M -quasicore of $\mathcal{I}$ has the global family modus ponens.

Theorem 1883 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -directional, then $Q^{\mathcal{I},M}$ has the global family modus ponens.*

Proof: Suppose $\mathcal{I}$ is M -directional with witnessing transformations β and let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$, such that $\phi \in T_\Sigma$ and $Q_\Sigma^{\mathcal{I},M}[\phi, \psi] \leq T$. Then, by Lemma 1882, $\phi \in T_\Sigma$ and $\beta_\Sigma[\phi, \psi] \leq T$. By M -directionality, $\phi \in T_\Sigma$ and $\phi \leq_{\Sigma}^{M,\mathcal{F}}(T) \psi$. Therefore, by the definition of $\leq_{\Sigma}^{M,\mathcal{F}}(T)$, $\psi \in T_\Sigma$. We conclude that, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,

$$\psi \in C_\Sigma(Q_\Sigma^{\mathcal{I},M}[\phi, \psi], \phi),$$

i.e., $Q^{\mathcal{I},M}$ has the global family modus ponens in $\mathcal{I}$. $\blacksquare$

Conversely, it turns out that, if the M -quasicore $Q^{\mathcal{I},M}$ of $\mathcal{I}$ has the global family modus ponens, then $\mathcal{I}$ is M -directional, with $Q^{\mathcal{I},M}$ as its set of witnessing transformations.

Theorem 1884 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $Q^{\mathcal{I},M}$ has the global family modus ponens in $\mathcal{I}$, then $\mathcal{I}$ is M -directional with witnessing transformations $Q^{\mathcal{I},M}$.*

Proof: We must show that, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\leq_{\Sigma}^{M,\mathcal{A}}(T) = Q_\Sigma^{\mathcal{I},M,\mathcal{A}}(T)$.

Let $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$, such that $\phi \leq_{\Sigma}^{M,\mathcal{A}}(T) \psi$ and $\sigma \in Q^{\mathcal{I},M}$. Then, by the definition of the M -quasicore, $\sigma_\Sigma^{\mathcal{A}}[\psi, \psi] \leq T$. Since $\phi \leq_{\Sigma}^{M,\mathcal{A}}(T) \psi$ and $\sigma^b \in M^-$, we get that $\sigma_\Sigma^{\mathcal{A}}[\phi, \psi] \leq T$. Therefore, $Q_\Sigma^{\mathcal{I},M,\mathcal{A}}[\phi, \psi] \leq T$, which gives $\langle \phi, \psi \rangle \in Q_\Sigma^{\mathcal{I},M,\mathcal{A}}(T)$. Thus, $\leq_{\Sigma}^{M,\mathcal{A}}(T) \leq Q_\Sigma^{\mathcal{I},M,\mathcal{A}}(T)$.

Conversely, to see that $Q_\Sigma^{\mathcal{I},M,\mathcal{A}}(T) \leq \leq_{\Sigma}^{M,\mathcal{A}}(T)$, it suffices to show that $Q^{\mathcal{I},M,\mathcal{A}}(T)$ is a qosystem on $\mathcal{A}$ that is M -compatible with T .

- By definition of the M -quasicore, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \mathbf{SEN}(\Sigma)$, $Q_\Sigma^{\mathcal{I},M,\mathcal{A}}[\phi, \phi] \leq T$, whence $Q^{\mathcal{I},M,\mathcal{A}}(T)$ is reflexive.
- Next let $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi, \chi \in \mathbf{SEN}(\Sigma)$, such that $Q_\Sigma^{\mathcal{I},M,\mathcal{A}}[\phi, \psi] \leq T$ and $Q_\Sigma^{\mathcal{I},M,\mathcal{A}}[\psi, \chi] \leq T$. For $\sigma^b, \tau^b \in Q^{\mathcal{I},M}$, note that, by the definition of the M -quasicore, the transformation $\tau^b(\sigma^b(z, x, \vec{p}), \sigma^b(z, y, \vec{p}), \vec{q}) \in$

$Q^{\mathcal{I},M}$. Hence, using modus ponens, we get, for all $\sigma^b \in Q^{\mathcal{I},M}$ and all $\vec{\xi} \in \text{SEN}(\Sigma')$,

$$\begin{aligned} & \sigma_{\Sigma}^A(\phi, \chi, \vec{\xi}) \\ & \in C_{\Sigma}^{\mathcal{I},A}(Q_{\Sigma'}^{\mathcal{I},M,A}[\sigma_{\Sigma}^A(\phi, \psi, \vec{\xi}), \sigma_{\Sigma}^A(\phi, \chi, \vec{\xi})], \sigma_{\Sigma}^A(\phi, \psi, \vec{\xi})) \\ & \leq C_{\Sigma'}^{\mathcal{I},A}(Q_{\Sigma'}^{\mathcal{I},M,A}[\psi, \chi], \sigma_{\Sigma}^A(\phi, \psi, \vec{\xi})). \end{aligned}$$

We conclude that $Q_{\Sigma}^{\mathcal{I},M,A}[\phi, \chi] \leq C_{\Sigma}^{\mathcal{I},A}(Q_{\Sigma}^{\mathcal{I},M,A}[\phi, \psi], Q_{\Sigma}^{\mathcal{I},M,A}[\psi, \chi])$ and, therefore, $Q^{\mathcal{I},M,A}(T)$ is also transitive.

- Suppose, next, that $\sigma^b \in M^+$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi, \vec{\chi} \in \text{SEN}(\Sigma)$, such that $\langle \phi, \psi \rangle \in Q_{\Sigma}^{\mathcal{I},M,A}(T)$ and $\sigma_{\Sigma}^b(\phi, \vec{\chi}) \in T_{\Sigma}$. Then $Q_{\Sigma}^{\mathcal{I},M,A}[\phi, \psi] \leq T$ and $\sigma^A(\phi, \vec{\chi}) \in T_{\Sigma}$. So we get

$$\begin{aligned} \sigma_{\Sigma}^A(\psi, \vec{\chi}) & \in C_{\Sigma}^{\mathcal{I},A}(Q_{\Sigma}^{\mathcal{I},M,A}[\sigma_{\Sigma}^A(\phi, \vec{\chi}), \sigma_{\Sigma}^A(\psi, \vec{\chi})], \sigma_{\Sigma}^A(\phi, \vec{\chi})) \\ & \subseteq C_{\Sigma}^{\mathcal{I},A}(Q_{\Sigma}^{\mathcal{I},M,A}[\phi, \psi], \sigma_{\Sigma}^A(\phi, \vec{\chi})) \\ & \subseteq T_{\Sigma}. \end{aligned}$$

Similarly, consider $\sigma^b \in M^-$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi, \vec{\chi} \in \text{SEN}(\Sigma)$, such that $\langle \phi, \psi \rangle \in Q_{\Sigma}^{\mathcal{I},M,A}(T)$ and $\sigma_{\Sigma}^b(\psi, \vec{\chi}) \in T_{\Sigma}$. Then $Q_{\Sigma}^{\mathcal{I},M,A}[\phi, \psi] \leq T$ and $\sigma^A(\psi, \vec{\chi}) \in T_{\Sigma}$. So we get

$$\begin{aligned} \sigma_{\Sigma}^A(\phi, \vec{\chi}) & \in C_{\Sigma}^{\mathcal{I},A}(Q_{\Sigma}^{\mathcal{I},M,A}[\sigma_{\Sigma}^A(\psi, \vec{\chi}), \sigma_{\Sigma}^A(\phi, \vec{\chi})], \sigma_{\Sigma}^A(\psi, \vec{\chi})) \\ & \subseteq C_{\Sigma}^{\mathcal{I},A}(Q_{\Sigma}^{\mathcal{I},M,A}[\phi, \psi], \sigma_{\Sigma}^A(\psi, \vec{\chi})) \\ & \subseteq T_{\Sigma}. \end{aligned}$$

Thus, $Q^{\mathcal{I},M,A}(T)$ is M -compatible with T .

We conclude that $Q^{\mathcal{I},M,A}(T)$ is a qosystem on $\mathcal{A}$ that is M -compatible with T , whence, by the maximality of $\leq^{M,A}(T)$, we get $Q^{\mathcal{I},M,A}(T) \leq \leq^{M,A}(T)$. ■

We now have a characterization of M -directionality in terms of the property of modus ponens of the M -quasicore $Q^{\mathcal{I},M}$ of the π -institution $\mathcal{I}$.

$$\mathcal{I} \text{ is } M\text{-directional} \longleftrightarrow Q^{\mathcal{I},M} \text{ has Global Family MP.}$$

Theorem 1885 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -directional if and only if $Q^{\mathcal{I},M}$ has the global family modus ponens in $\mathcal{I}$.*

Proof: Theorem 1883 gives the “only if” and the “if” is by Theorem 1884. ■

As a corollary, we obtain

Corollary 1886 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b having two distinguished arguments, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -directional with witnessing transformations β , then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,*

$$C(Q_\Sigma^{\mathcal{I}, M}[\phi, \psi]) = C(\beta_\Sigma[\phi, \psi]).$$

Proof: If $\mathcal{I}$ is M -directional, with witnessing transformations β , then, by Theorems 1883 and 1884, both β and $Q^{\mathcal{I}, M}$ are families of witnessing transformations for the M -directionality of $\mathcal{I}$. Therefore, by Lemma 1874, we get the conclusion. ■

We get relatively easily another related characterization of M -directionality.

$\mathcal{I}$ is M -directional $\longleftrightarrow Q^{\mathcal{I}, M}$ Defines M -Leibniz QoSystems.

Theorem 1887 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -directional if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$\leq^{M, \mathcal{A}}(T) = Q^{\mathcal{I}, M, \mathcal{A}}(T).$$

Proof: If $\mathcal{I}$ is M -directional, then, by Theorem 1883 and Theorem 1884, $Q^{\mathcal{I}, M}$ constitutes a collection of witnessing transformations, whence, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$ $\leq^{M, \mathcal{A}}(T) = Q^{\mathcal{I}, M, \mathcal{A}}(T)$.

The converse follows by the definition of M -directionality, since, in that case, $Q^{\mathcal{I}, M}$ forms a collection of witnessing transformations. ■

We finally show that the property that separates M -order monotonicity from M -directionality is the M -order compatibility property with respect to the theory family generated by the M -quasicore.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. In analogy with the property of the reflexive core being Leibniz, we say that the M -quasicore $Q^{\mathcal{I}, M}$ is **order Leibniz** if, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, all $T \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{A})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$,

$$\phi \leq_\Sigma^{M, \mathcal{A}}(C^{\mathcal{I}, \mathcal{A}}(Q_\Sigma^{\mathcal{I}, M, \mathcal{A}}[\phi, \psi])) \psi.$$

This property is weaker than $Q^{\mathcal{I}, M}$ having the global family modus ponens, i.e., if $Q^{\mathcal{I}, M}$ has the global family modus ponens, then it is order Leibniz.

Proposition 1888 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. If $Q^{\mathcal{I}, M}$ has the global family modus ponens, then it is order Leibniz.*

Proof: If $Q^{\mathcal{I},M}$ has the global family modus ponens, then, by Theorem 1884, we get, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,

$$\leq^{M,\mathcal{A}}(T) = Q^{\mathcal{I},M,\mathcal{A}}(T).$$

Therefore, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$, by considering, in particular, $T = C^{\mathcal{I},\mathcal{A}}(Q_{\Sigma}^{\mathcal{I},M,\mathcal{A}}[\phi, \psi])$, and taking into account that $Q_{\Sigma}^{\mathcal{I},M,\mathcal{A}}[\phi, \psi] \leq C^{\mathcal{I},\mathcal{A}}(Q_{\Sigma}^{\mathcal{I},M,\mathcal{A}}[\phi, \psi])$, we get that $\phi \leq_{\Sigma}^{M,\mathcal{A}}(C^{\mathcal{I},\mathcal{A}}(Q_{\Sigma}^{\mathcal{I},M,\mathcal{A}}[\phi, \psi])) \psi$. Thus, $Q^{\mathcal{I},M}$ is order Leibniz. ■

In the opposite direction, in an M -order monotone π -institution $\mathcal{I}$, if the M -quasicore is order Leibniz, then it has the global family modus ponens in $\mathcal{I}$.

Proposition 1889 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be an M -order monotone π -institution based on $\mathbf{F}$. If $Q^{\mathcal{I},M}$ is order Leibniz, then it has the global family modus ponens in $\mathcal{I}$.*

Proof: Suppose that $\mathcal{I}$ is M -order monotone and that $Q^{\mathcal{I},M}$ is order Leibniz. Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system, $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\phi \in T_{\Sigma}$ and $Q_{\Sigma}^{\mathcal{I},M,\mathcal{A}}[\phi, \psi] \leq T$. Since $Q^{\mathcal{I},M}$ is order Leibniz, we have

$$\phi \leq_{\Sigma}^{M,\mathcal{A}}(C(Q_{\Sigma}^{\mathcal{I},M,\mathcal{A}}[\phi, \psi])) \psi,$$

whence, since $\mathcal{I}$ is M -order monotone and $Q_{\Sigma}^{\mathcal{I},M,\mathcal{A}}[\phi, \psi] \leq T$,

$$\phi \leq_{\Sigma}^{M,\mathcal{A}}(T) \psi.$$

Therefore, since $\phi \in T_{\Sigma}$, we get, by M -compatibility of $\leq^{M,\mathcal{A}}(T)$ with T , that $\psi \in T_{\Sigma}$. We conclude that $Q^{\mathcal{I},M}$ has the global family modus ponens in $\mathcal{I}$. ■

We now show that a π -institution is M -directional if and only if it is M -order monotone and it has an order Leibniz M -quasicore.

$$\begin{aligned} M\text{-Directionality} &= Q^{\mathcal{I},M} \text{ has Global Family MP} \\ &= Q^{\mathcal{I},M} \text{ Defines Leibniz QoSystems} \\ &= M\text{-Order Monotonicity} + Q^{\mathcal{I},M} \text{ Order Leibniz} \end{aligned}$$

Theorem 1890 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ be a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -directional if and only if it is M -order monotone and has an order Leibniz M -quasicore.*

Proof: Suppose, first, that $\mathcal{I}$ is M -directional. Then it is M -order monotone by Theorem 1881. Moreover, its M -quasicore has the global family modus ponens by Theorem 1883 and, hence, by Proposition 1888, its M -quasicore is order Leibniz.

Suppose, conversely, that $\mathcal{I}$ is M -order monotone with an order Leibniz M -quasicore. Then, by Proposition 1889, its M -quasicore has the global family modus ponens and, therefore, by Theorem 1885, $\mathcal{I}$ is M -directional. ■

25.6 c-Reflectivity and Truth Inequationality

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The polar π -institution $\langle \mathcal{I}, M \rangle$ is called **truth inequational** and the π -institution $\mathcal{I}$ is called **M -truth inequational** if there exists a collection $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , with a single distinguished argument, such that, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$,

$$\phi \in T_\Sigma \quad \text{iff} \quad \tau_\Sigma^b[\phi] \leq \leq^{M, \mathcal{F}}(T).$$

In this case τ^b is called a family of **witnessing transformations for the M -truth inequationality of $\mathcal{I}$** .

We can show, based on preceding work, that every β -order algebraizable π -institution $\mathcal{I}$ is B -truth inequational, where B is the polarity induced by β .

Proposition 1891 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b , having two distinguished arguments, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is β -order algebraizable, then $\mathcal{I}$ is B -truth inequational.*

Proof: Suppose $\mathcal{I}$ is β -order algebraizable. Then, by Corollary 1880, it is B -directional, with witnessing transformations β . Thus, by Theorem 1865, there exists $\alpha : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$, with a single distinguished argument, such that, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$, all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \mathbf{SEN}(\Sigma)$,

$$\begin{aligned} \phi \in T_\Sigma & \quad \text{iff} \quad \beta^{\mathcal{A}}[\alpha_\Sigma^{\mathcal{A}}[\phi]] \leq T \\ & \quad \text{iff} \quad \alpha_\Sigma^{\mathcal{A}}[\phi] \leq \leq^{B, \mathcal{A}}(T). \end{aligned}$$

Thus, $\mathcal{I}$ is B -truth inequational, with witnessing transformations α . ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ be a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. We say that

$\leq^M$ is **completely order reflecting** or **c-reflecting**, for short, if, for all $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$,

$$\bigcap_{T \in \mathcal{T}} \leq^{M, \mathcal{F}}(T) \leq \leq^{M, \mathcal{F}}(T') \quad \text{implies} \quad \bigcap_{T \in \mathcal{T}} T \leq T'.$$

If this is the case, we call $\mathcal{I}$ **M -c-reflective**.

We formulate an equivalent condition to M -c-reflectivity.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Given an $\mathbf{F}$ -algebraic system $\mathcal{A}$ and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, we define the qosystem

$$\approx^{M, \mathcal{A}}(T) = \bigcap \{ \leq^{M, \mathcal{A}}(T') : T \leq T' \in \text{FiFam}^{\mathcal{I}}(\mathcal{A}) \}.$$

By analogy with the Suszko congruence system, we call $\approx^{M, \mathcal{A}}(T)$ the **M -Suszko qosystem of T** .

Lemma 1892 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -c-reflective if and only if, for all $T, T' \in \text{ThFam}(\mathcal{I})$,*

$$\approx^{M, \mathcal{F}}(T) \leq \leq^{M, \mathcal{F}}(T') \quad \text{implies} \quad T \leq T'.$$

Proof: Assume, first, that $\mathcal{I}$ is M -c-reflective and let $T, T' \in \text{ThFam}(\mathcal{I})$, such that $\approx^{M, \mathcal{F}}(T) \leq \leq^{M, \mathcal{F}}(T')$. Then, we have

$$\bigcap \{ \leq^{M, \mathcal{F}}(T'') : T \leq T'' \in \text{ThFam}(\mathcal{I}) \} \leq \leq^{M, \mathcal{F}}(T').$$

Therefore, by M -c-reflectivity, $\bigcap \{ T'' : T \leq T'' \in \text{ThFam}(\mathcal{I}) \} \leq T'$, i.e., $T \leq T'$.

Suppose, conversely, that the displayed condition holds and let $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$, such that $\bigcap_{T \in \mathcal{T}} \leq^{M, \mathcal{F}}(T) \leq \leq^{M, \mathcal{F}}(T')$. Then, we get

$$\begin{aligned} \approx^{M, \mathcal{F}}(\bigcap \mathcal{T}) &= \bigcap \{ \leq^{M, \mathcal{F}}(T) : \bigcap \mathcal{T} \leq T \in \text{ThFam}(\mathcal{I}) \} \\ &\leq \bigcap \{ \leq^{M, \mathcal{F}}(T) : T \in \mathcal{T} \} \\ &\leq \leq^{M, \mathcal{F}}(T'). \end{aligned}$$

Thus, by hypothesis, $\bigcap \mathcal{T} \leq T'$ and, therefore, $\mathcal{I}$ is M -c-reflective. ■

Furthermore, under M -order monotonicity, it turns out that M -c-reflectivity is equivalent to the injectivity of the M -Leibniz order operator.

Lemma 1893 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -order monotone, then $\mathcal{I}$ is M -c-reflective if and only if $\leq^{M, \mathcal{F}}$ is injective on theory families.*

Proof: Suppose that $\mathcal{I}$ is M -order monotone.

Assume, first, that $\mathcal{I}$ is M -c-reflective and let $T, T' \in \text{ThFam}(\mathcal{I})$, such that $\leq^{M, \mathcal{F}}(T) = \leq^{M, \mathcal{F}}(T')$. Then, we have

$$\leq^{M, \mathcal{F}}(T) = \leq^{M, \mathcal{F}}(T) \cap \leq^{M, \mathcal{F}}(T') \leq \leq^{M, \mathcal{F}}(T'),$$

whence, by M -c-reflectivity, $T \cap T' \leq T'$, i.e., $T \leq T'$. By symmetry, we get $T = T'$ and, therefore, $\leq^{M, \mathcal{F}}$ is injective on theory families.

Assume, conversely, that $\leq^{M, \mathcal{F}}$ is injective on theory families and let $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$, such that $\bigcap_{T \in \mathcal{T}} \leq^{M, \mathcal{F}}(T) \leq \leq^{M, \mathcal{F}}(T')$. Then we get

$$\begin{aligned} \leq^{M, \mathcal{F}}(\bigcap_{T \in \mathcal{T}} T) &= \bigcap_{T \in \mathcal{T}} \leq^{M, \mathcal{F}}(T) \quad (\text{monotonicity}) \\ &= \bigcap_{T \in \mathcal{T}} \leq^{M, \mathcal{F}}(T) \cap \leq^{M, \mathcal{F}}(T') \quad (\text{hypothesis}) \\ &= \leq^{M, \mathcal{F}}(\bigcap \mathcal{T} \cap T'). \quad (\text{monotonicity}) \end{aligned}$$

Thus, by injectivity, $\bigcap \mathcal{T} = \bigcap \mathcal{T} \cap T'$, whence $\bigcap \mathcal{T} \leq T'$ and, therefore, $\mathcal{I}$ is M -c-reflective. $\blacksquare$

It is always the case that truth inequationality implies c-reflectivity.

Theorem 1894 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ be a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -truth inequational, then it is M -c-reflective.*

Proof: Suppose that $\mathcal{I}$ is M -truth inequational, with witnessing transformations τ^b , and let $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$, such that $\bigcap_{T \in \mathcal{T}} \leq^{M, \mathcal{F}}(T) \leq \leq^{M, \mathcal{F}}(T')$. Then

$$\begin{aligned} \bigcap_{T \in \mathcal{T}} T &= \bigcap_{T \in \mathcal{T}} \tau^b(\leq^{M, \mathcal{F}}(T)) \quad (\text{Truth Inequationality}) \\ &= \tau^b(\bigcap_{T \in \mathcal{T}} \leq^{M, \mathcal{F}}(T)) \quad (\text{Set Theory}) \\ &\leq \tau^b(\leq^{M, \mathcal{F}}(T')) \quad (\text{Hypothesis and Lemma 94}) \\ &= T'. \quad (\text{Truth Inequationality}) \end{aligned}$$

Thus, $\mathcal{I}$ is M -c-reflective. $\blacksquare$

Recall the characterization of truth equationality in terms of the solubility property of the Suszko core of the π -institution. We now work to establish an analog for truth inequationality. More precisely, we provide a characterization of truth inequationality in terms of the order solubility property of the order core of a π -institution. Then, we provide an exact description of those M -c-reflective π -institutions which are M -truth inequational.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. We define the M -order (**Suszko**) **core** of $\mathcal{I}$ to be the collection

$$O^{\mathcal{I}, M} = \{\sigma^b \in N^b : (\forall T \in \text{ThFam}(\mathcal{I}))(\sigma^b[T] \leq \leq^{M, \mathcal{F}}(T))\}.$$

Lemma 1895 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. For all σ^b in N^b , the following conditions are equivalent:*

- (i) *For every $T \in \text{ThFam}(\mathcal{I})$, $\sigma^b[T] \leq \lesssim^{M, \mathcal{F}}(T)$;*
- (ii) *For every $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$, $\sigma_\Sigma^b[\phi] \leq \lesssim^{M, \mathcal{F}}(C(\phi))$.*

Proof: Suppose Condition (i) holds and let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \mathbf{SEN}^b(\Sigma)$. Then, setting $T = C(\phi)$ in (i), we obtain $\sigma^b[C(\phi)] \leq \lesssim^{M, \mathcal{F}}(C(\phi))$, whence, a fortiori, $\sigma_\Sigma^b[\phi] \leq \lesssim^{M, \mathcal{F}}(C(\phi))$. Assume, conversely, that Condition (ii) holds and let $T \in \text{ThFam}(\mathcal{I})$. Then, we get

$$\begin{aligned} \sigma^b[T] &= \bigcup \{ \sigma_\Sigma^b[\phi] : \phi \in T_\Sigma, \Sigma \in |\mathbf{Sign}^b| \} \quad (\text{definition}) \\ &\leq \bigcup \{ \lesssim^{M, \mathcal{F}}(C(\phi)) : \phi \in T_\Sigma, \Sigma \in |\mathbf{Sign}^b| \} \quad (\text{Condition (ii)}) \\ &\leq \bigcup \{ \lesssim^{M, \mathcal{F}}(T) : \phi \in T_\Sigma, \Sigma \in |\mathbf{Sign}^b| \} \quad (\text{monotonicity of } \lesssim^{M, \mathcal{F}}) \\ &= \lesssim^{M, \mathcal{F}}(T). \end{aligned}$$

Thus shows that Condition (i) holds and, therefore, that the two conditions are equivalent. $\blacksquare$

By Lemma 1895, this definition is equivalent to setting

$$\begin{aligned} O^{\mathcal{I}, M} &= \{ \sigma^b \in N^b : (\forall \Sigma \in |\mathbf{Sign}^b|)(\forall \phi \in \mathbf{SEN}^b(\Sigma)) \\ &\quad (\sigma_\Sigma^b[\phi] \leq \lesssim^{M, \mathcal{F}}(C(\phi))) \}. \end{aligned}$$

It is clear, by definition that the M -order core of a π -institution satisfies the following property:

Proposition 1896 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. For every $T \in \text{ThFam}(\mathcal{I})$,*

$$T \leq O^{\mathcal{I}, M}(\lesssim^{M, \mathcal{F}}(T)).$$

Proof: Let $T \in \text{ThFam}(\mathcal{I})$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$,

$$\begin{aligned} \phi \in T_\Sigma &\text{ implies } O_\Sigma^{\mathcal{I}, M}[\phi] \leq \lesssim^{M, \mathcal{F}}(T) \quad (\text{definition of } O^{\mathcal{I}, M}) \\ &\text{ implies } O_\Sigma^{\mathcal{I}, M}[\phi] \leq \lesssim^{M, \mathcal{F}}(T). \quad (\lesssim^{M, \mathcal{F}}(T) \leq \lesssim^{M, \mathcal{F}}(T)) \end{aligned}$$

Thus, we get that $T \leq O^{\mathcal{I}, M}(\lesssim^{M, \mathcal{F}}(T))$. $\blacksquare$

It is possible, but not necessary, that the M -order core of a π -institution satisfies the reverse inclusion. We call this property order solubility.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. We say that the M -order core of $\mathcal{I}$ is **order soluble** if, for all $T \in \text{ThFam}(\mathcal{I})$,

$$O^{\mathcal{I}, M}(\lesssim^{M, \mathcal{F}}(T)) \leq T.$$

In other words $O^{\mathcal{I},M}$ is order soluble if, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$O_{\Sigma}^{\mathcal{I},M}[\phi] \leq^{\leq^{M,\mathcal{F}}}(T) \quad \text{implies} \quad \phi \in T_{\Sigma}.$$

It turns out that possession of the order solubility property by the M -order core intrinsically characterizes M -truth inequationality. We show, first, that the M -order core being order soluble is necessary for M -truth inequationality. To see this, observe that, in case a π -institution is M -truth inequational, the witnessing transformations form a subset of the M -order core.

Lemma 1897 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -truth inequational, with witnessing transformations $\tau^b \subseteq N^b$, then $\tau^b \subseteq O^{\mathcal{I},M}$.*

Proof: By truth inequationality, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$\phi \in T_{\Sigma} \quad \text{iff} \quad \tau_{\Sigma}^b[\phi] \leq^{\leq^{M,\mathcal{F}}}(T).$$

Thus, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$\begin{aligned} \phi \in T_{\Sigma} & \quad \text{iff} \quad (\forall T \leq T' \in \text{ThFam}(\mathcal{I}))(\phi \in T'_{\Sigma}) \\ & \quad \text{iff} \quad (\forall T \leq T' \in \text{ThFam}(\mathcal{I}))(\tau_{\Sigma}^b[\phi] \leq^{\leq^{M,\mathcal{F}}}(T')) \\ & \quad \text{iff} \quad \tau_{\Sigma}^b[\phi] \leq \bigcap \{ \leq^{M,\mathcal{F}}(T') : T \leq T' \in \text{ThFam}(\mathcal{I}) \} \\ & \quad \text{iff} \quad \tau_{\Sigma}^b[\phi] \leq^{\approx^{M,\mathcal{F}}}(T). \end{aligned}$$

We conclude, by the definition of $O^{\mathcal{I},M}$, that $\tau^b \subseteq O^{\mathcal{I},M}$. ■

Now we prove the necessity of order solubility for truth inequationality.

Theorem 1898 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is M -truth inequational, then $O^{\mathcal{I},M}$ is order soluble.*

Proof: Suppose that $\mathcal{I}$ is M -truth equational, with witnessing equations τ^b . Then, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$\begin{aligned} O_{\Sigma}^{\mathcal{I},M}[\phi] \leq^{\leq^{M,\mathcal{F}}}(T) & \quad \text{implies} \quad \tau_{\Sigma}^b[\phi] \leq^{\leq^{M,\mathcal{F}}}(T) \quad (\text{Lemma 1897}) \\ & \quad \text{iff} \quad \phi \in T_{\Sigma}. \quad (\text{truth inequationality}) \end{aligned}$$

Thus, $O^{\mathcal{I},M}$ is order soluble. ■

The reverse implication, which also holds and completes the promised characterization of M -truth inequationality in terms of the M -order core, is presented in the following result.

Theorem 1899 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. If $O^{\mathcal{I},M}$ is order soluble, then $\mathcal{I}$ is M -truth inequational, with witnessing equations $O^{\mathcal{I},M}$.*

Proof: It suffices to show that, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$\phi \in T_\Sigma \quad \text{iff} \quad O_{\Sigma}^{\mathcal{I},M}[\phi] \leq \leq^{M,\mathcal{F}}(T).$$

The left-to-right implication is given in Proposition 1896, whereas the converse is ensured by the postulated order solubility of $O^{\mathcal{I},M}$. ■

Theorems 1898 and 1899 provide the promised characterization of M -truth inequationality in terms of the order solubility of the M -order core.

$$\mathcal{I} \text{ is } M\text{-Truth Inequational} \longleftrightarrow O^{\mathcal{I},M} \text{ is Soluble.}$$

Theorem 1900 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -truth inequational if and only if $O^{\mathcal{I},M}$ is order soluble.*

Proof: Theorem 1898 gives the “only if” and the “if” is by Theorem 1899. ■

If $\mathcal{I}$ is M -truth inequational, then the M -order core defines theory families in $\mathcal{I}$ in terms of their M -Leibniz qosystems.

Proposition 1901 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. If $O^{\mathcal{I},M}$ is order soluble, then, for all $T \in \text{ThFam}(\mathcal{I})$,*

$$T = O^{\mathcal{I},M}(\leq^{M,\mathcal{F}}(T)).$$

Proof: If $O^{\mathcal{I},M}$ is order soluble, then, by Theorem 1899, $O^{\mathcal{I},M}$ forms a set of witnessing transformations for the M -truth inequationality of $\mathcal{I}$. Therefore, by definition, we get that, for every $T \in \text{ThFam}(\mathcal{I})$, $T = O^{\mathcal{I},M}(\leq^{M,\mathcal{F}}(T))$. ■

In fact, this property may also be restated as another characterization of truth inequationality. Let us say that $O^{\mathcal{I},M}$ **defines theory families** if, for all $T \in \text{ThFam}(\mathcal{I})$, $T = O^{\mathcal{I},M}(\leq^{M,\mathcal{F}}(T))$. Then we have:

$$\mathcal{I} \text{ is } M\text{-Truth Equational} \longleftrightarrow O^{\mathcal{I},M} \text{ Defines Theory Families.}$$

Theorem 1902 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -truth inequational if and only if, for all $T \in \text{ThFam}(\mathcal{I})$,*

$$T = O^{\mathcal{I},M}(\leq^{M,\mathcal{F}}(T)).$$

Proof: If $\mathcal{I}$ is truth equational, then, by Theorem 1898, $O^{\mathcal{I},M}$ is order soluble. Thus, by Proposition 1901, for all $T \in \text{ThFam}(\mathcal{I})$, $T = O^{\mathcal{I},M}(\leq^{M,\mathcal{F}}(T))$.

Conversely, if, for all $T \in \text{ThFam}(\mathcal{I})$, $T = O^{\mathcal{I},M}(\leq^{M,\mathcal{F}}(T))$, then, $O^{\mathcal{I},M}$ is order soluble. Thus, again by Theorem 1900, $O^{\mathcal{I},M}$ is a set of witnessing equations and $\mathcal{I}$ is M -truth inequational. ■

We finally show that the property that separates M -complete reflectivity from M -truth inequationality is exactly the adequacy property of the M -order core. Roughly speaking, this property ensures that the M -order core is rich enough to define M -Suszko qosystems in terms of the M -Leibniz qosystems of theory families that it selects via inclusion.

We have the following relationship connecting the M -order core with both M -Leibniz quosystems and M -Suszko qosystems of enveloping theory families.

Proposition 1903 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$,*

$$\bigcap \{ \leq^{M, \mathcal{F}}(T) : O_{\Sigma}^{\mathcal{I}, M}[\phi] \leq \leq^{M, \mathcal{F}}(T) \} \leq \approx^{M, \mathcal{F}}(C(\phi)).$$

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \mathbf{SEN}^b(\Sigma)$. Then, for all $T \in \text{ThFam}(\mathcal{I})$,

$$\begin{aligned} \phi \in T_{\Sigma} & \text{ implies } O_{\Sigma}^{\mathcal{I}, M}[\phi] \leq \approx^{M, \mathcal{F}}(T) \quad (M\text{-order core}) \\ & \text{ implies } O_{\Sigma}^{\mathcal{I}, M}[\phi] \leq \leq^{M, \mathcal{F}}(T). \end{aligned}$$

Therefore, we have

$$\begin{aligned} \bigcap \{ \leq^{M, \mathcal{F}}(T) : O_{\Sigma}^{\mathcal{I}, M}[\phi] \leq \leq^{M, \mathcal{F}}(T) \} & \leq \bigcap \{ \leq^{M, \mathcal{F}}(T) : O_{\Sigma}^{\mathcal{I}, M}[\phi] \leq \approx^{M, \mathcal{F}}(T) \} \\ & \leq \bigcap \{ \leq^{M, \mathcal{F}}(T) : \phi \in T_{\Sigma} \} \\ & = \approx^{M, \mathcal{F}}(C(\phi)). \end{aligned}$$

■

It is possible, but not necessary, that the M -order core of a π -institution satisfies, for every $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$, the reverse inclusion of that given in Proposition 1903:

$$\approx^{M, \mathcal{F}}(C(\phi)) \leq \bigcap \{ \leq^{M, \mathcal{F}}(T) : O_{\Sigma}^{\mathcal{I}, M}[\phi] \leq \leq^{M, \mathcal{F}}(T) \}.$$

Intuitively speaking, this means that the M -order core $O^{\mathcal{I}, M}$ is rich enough to allow, for every Σ -sentence ϕ , the determination of those theory families whose M -Leibniz qosystems form a covering of the M -Suszko qosystem of $C(\phi)$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. We say that the M -order core $O^{\mathcal{I}, M}$ of $\mathcal{I}$ is **order adequate** if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$,

$$\approx^{M, \mathcal{F}}(C(\phi)) = \bigcap \{ \leq^{M, \mathcal{F}}(T) : O_{\Sigma}^{\mathcal{I}, M}[\phi] \leq \leq^{M, \mathcal{F}}(T) \}.$$

It is not difficult to see that, if $O^{\mathcal{I}, M}$ is order soluble, then it is order adequate.

Corollary 1904 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. If $O^{\mathcal{I}, M}$ is order soluble, then it is order adequate.*

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \mathbf{SEN}^b(\Sigma)$. Then we have

$$\begin{aligned} \approx^{M, \mathcal{F}}(C(\phi)) &= \bigcap \{ \leq^{M, \mathcal{F}}(T) : \phi \in T_\Sigma \} \quad (\text{definition of } \approx^{M, \mathcal{F}}(C(\phi))) \\ &= \bigcap \{ \leq^{M, \mathcal{F}}(T) : O_\Sigma^{\mathcal{I}, M}[\phi] \leq \leq^{M, \mathcal{F}}(T) \}. \\ &\quad (\text{order solubility of } S^{\mathcal{I}} \text{ and Proposition 1901}) \end{aligned}$$

We conclude that $O^{\mathcal{I}, M}$ is order adequate. $\blacksquare$

In the opposite direction, in an M -c-reflective π -institution $\mathcal{I}$, if the M -order core is order adequate, then it is also order soluble.

Proposition 1905 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ an M -c-reflective π -institution based on $\mathbf{F}$. If $O^{\mathcal{I}, M}$ is order adequate, then it is order soluble.*

Proof: Suppose that $\mathcal{I}$ is M -c-reflective and that $O^{\mathcal{I}, M}$ is order adequate. We must show that, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$

$$\phi \in T_\Sigma \quad \text{iff} \quad O_\Sigma^{\mathcal{I}, M}[\phi] \leq \leq^{M, \mathcal{F}}(T).$$

The implication left-to-right is always satisfied by Proposition 1896. For the converse, assume that $O_\Sigma^{\mathcal{I}, M}[\phi] \leq \leq^{M, \mathcal{F}}(T)$. Then, by the adequacy of $O^{\mathcal{I}, M}$, we get that $\approx^{M, \mathcal{F}}(C(\phi)) \leq \leq^{M, \mathcal{F}}(T)$. Thus, by M -c-reflectivity, we conclude that $C(\phi) \leq T$, which gives $\phi \in T_\Sigma$. $\blacksquare$

We finally show that a π -institution is M -truth inequational if and only if it is M -c-reflective and it has an order adequate M -order core.

$$\begin{aligned} M\text{-Truth Inequationality} &= O^{\mathcal{I}, M} \text{ Order Soluble} \\ &= O^{\mathcal{I}, M} \text{ Defines Theory Families} \\ &= M\text{-c-Reflectivity} + O^{\mathcal{I}, M} \text{ Order Adequate} \end{aligned}$$

Theorem 1906 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -truth inequational if and only if it is M -c-reflective and has an order adequate M -order core.*

Proof: Suppose, first, that $\mathcal{I}$ is M -truth inequational. Then it is M -c-reflective by Theorem 1894. Moreover, its M -order core is order soluble by Theorem 1898 and, hence, by Corollary 1904, its M -order core is order adequate.

Suppose, conversely, that $\mathcal{I}$ is M -c-reflective with an order adequate M -order core. Then, by Proposition 1905, its M -order core is order soluble and, therefore, by Theorem 1900, $\mathcal{I}$ is M -truth inequational. $\blacksquare$

Taking into account Lemma 1893 we obtain the following

Corollary 1907 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ an M -order monotone π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -truth inequational if and only if it is M -order injective and has an order adequate M -order core.*

Proof: By Theorem 1906 and Lemma 1893. ■

Finally, it is not difficult to see that M -truth inequationality transfers from a π -institution to all $\mathcal{I}$ -matrix families.

Theorem 1908 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathcal{I}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ be a π -institution based on $\mathbf{F}$. $\mathcal{I}$ is M -truth inequational, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ in N^b , if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $T = \tau^{\mathcal{A}}(\leq^{M, \mathcal{A}}(T))$.*

Proof: Suppose $\mathcal{I}$ is truth equational, with witnessing transformations $\tau^b : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^2$ and let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, by Lemma 51, $\alpha^{-1}(T) \in \text{ThFam}(\mathcal{I})$, whence, by hypothesis, $\alpha^{-1}(T) = \tau^b(\leq^{M, \mathcal{F}}(\alpha^{-1}(T)))$. Hence, by Lemma 1872, $\alpha^{-1}(T) = \tau^b(\alpha^{-1}(\leq^{M, \mathcal{A}}(T)))$. Therefore, for all $\Sigma \in |\mathbf{Sign}^b|$, $\phi \in \mathbf{SEN}^b(\Sigma)$, we get

$$\begin{aligned} \alpha_\Sigma(\phi) \in T_{F(\Sigma)} & \text{ iff } \phi \in \alpha_\Sigma^{-1}(T_{F(\Sigma)}) \\ & \text{ iff } \tau_\Sigma^b[\phi] \leq \alpha^{-1}(\leq^{M, \mathcal{A}}(T)) \\ & \text{ iff } \alpha(\tau_\Sigma^b[\phi]) \leq \leq^{M, \mathcal{A}}(T) \\ & \text{ iff } \tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_\Sigma(\phi)] \leq \leq^{M, \mathcal{A}}(T). \quad (\langle F, \alpha \rangle \text{ surjective}) \end{aligned}$$

Taking again into account the surjectivity of $\langle F, \alpha \rangle$, we conclude that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}(\Sigma)$, $\phi \in T_\Sigma$ if and only if $\tau_\Sigma^{\mathcal{A}}[\phi] \leq \leq^{M, \mathcal{A}}(T)$, i.e., $T = \tau^{\mathcal{A}}(\leq^{M, \mathcal{A}}(T))$. ■

25.7 Order Algebraizability

Theorem 1909 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b having two distinguished arguments, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ an M -directional π -institution based on $\mathbf{F}$, with witnessing transformations β , such that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$, all σ^b, τ^b in N^b , and all $\vec{\chi} \in \mathbf{SEN}^b(\Sigma)$,*

$$\beta_\Sigma[\sigma_\Sigma^b(\psi, \vec{\chi}), \tau_\Sigma^b(\psi, \vec{\chi})] \leq C(\vec{\beta}_\Sigma[\phi, \psi], \beta_\Sigma[\sigma_\Sigma^b(\phi, \vec{\chi}), \tau_\Sigma^b(\phi, \vec{\chi})]).$$

Then the following conditions are equivalent:

- (i) $\mathcal{I}$ is β -order algebraized by $\{\langle \mathcal{A}, \leq^{\mathcal{A}, T}(T) \rangle : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}$;

- (ii) $\mathcal{I}$ is β -order algebraizable;
- (iii) $\mathcal{I}$ is M -truth inequational;
- (iv) $\mathcal{I}$ is M -order injective and has an order adequate M -order core.

Proof:

(i) $\Rightarrow$ (ii) This implication is trivial.

(ii) $\Rightarrow$ (iii) By hypothesis, β witnesses the M -directionality of $\mathcal{I}$. Therefore, by Theorem 1877, $\leq^M = \leq^B$. Thus, since, by hypothesis, $\mathcal{I}$ is β -order algebraizable, by Proposition 1891, $\mathcal{I}$ is M -truth equational, with witnessing transformations β .

(iii) $\Rightarrow$ (i) Suppose $\mathcal{I}$ is M -truth inequational, with witnessing transformations $\tau^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$, having a single distinguished argument. Thus, we have, for every $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$\phi \in T_\Sigma \quad \text{iff} \quad \tau_\Sigma^b[\phi] \leq \leq_{\Sigma}^{M, \mathcal{F}}(T).$$

Thus, by M -directionality, $\phi \in T_\Sigma$ if and only if $\beta[\tau_\Sigma^b[\phi]] \leq T$. Thus, we get that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$,

$$C(\phi) = C(\beta[\tau_\Sigma^b[\phi]]). \quad (25.1)$$

Since, by hypothesis, $\mathcal{I}$ is M -directional, we have, by Theorem 1877, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$,

$$\begin{aligned} \beta_\Sigma[\phi, \phi] &\leq \text{Thm}(\mathcal{I}); \\ \beta_\Sigma[\phi, \chi] &\leq C(\beta_\Sigma[\phi, \psi], \beta_\Sigma[\psi, \chi]). \end{aligned} \quad (25.2)$$

Given the hypothesis, Conditions (25.2) and Condition (25.1), we get, by Theorem 1865, that $\mathcal{I}$ is β -order algebraizable. Therefore, again by Theorem 1865, $\mathcal{I}$ is β -order algebraized by the class $\{\langle \mathcal{A}, \leq^{\mathcal{A}, T}(T) \rangle : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}$.

- (iii) $\Rightarrow$ (iv) Since $\mathcal{I}$ is M -truth inequational, by Theorem 1906, it is M -c-reflective and has an order adequate M -order core. Since $\mathcal{I}$ is M -directional, by Theorem 1890, it is M -order monotone. Hence, since it is M -c-reflective, by Lemma 1893, it is M -order injective. Thus, $\mathcal{I}$ is M -order injective and has an order adequate M -order core.
- (iv) $\Rightarrow$ (iii) Suppose $\mathcal{I}$ is M -order injective, with an order adequate M -order core. Since, by hypothesis, $\mathcal{I}$ is M -directional, it is, by Theorem 1890, M -order monotone. Thus, since it is, by hypothesis, M -order injective, it is by Lemma 1893, M -c-reflective. Being M -c-reflective with an M -order adequate M -order core, it is, by Theorem 1906, M -truth inequational.

■

Theorem 1910 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. The following conditions are equivalent:*

- (i) *There exists a polarity $M = (M^+, M^-)$ for $\mathbf{F}$, such that $\mathcal{I}$ is M -order monotone, M -order injective, $\leq^M$ is antisymmetric on $\{T : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}$, with an order Leibniz M -quasicore and an order adequate M -order core;*
- (ii) *$\mathcal{I}$ is order algebraizable, i.e., it is β -order algebraizable, for some $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b having two distinguished arguments.*

If Condition (i) holds, then β can be chosen so that $\leq^M = \leq^B$ and

$$\{\langle \mathcal{A}, \leq^{\mathcal{A}, T} \rangle : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}$$

generates the β -order class of $\mathcal{I}$.

If Condition (ii) holds, then Condition (i) holds with $M = B$.

Proof:

- (i) $\Rightarrow$ (ii) Suppose Condition (i) holds. Since, by hypothesis, $\mathcal{I}$ is M -order monotone and has an order Leibniz M -quasicore, we get, by Theorem 1890, that $\mathcal{I}$ is M -directional, with some family β of witnessing transformations. Thus, by Theorem 1877, $\leq^M = \leq^B$. By hypothesis and Theorem 1906, we get that $\mathcal{I}$ is M -truth inequational. Therefore, by hypothesis, Theorem 1863 and Theorem 1909, we get that $\mathcal{I}$ is β -order algebraizable and that its β -order class is generated by $\{\langle \mathcal{A}, \leq^{\mathcal{A}, T} \rangle : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}$.
- (ii) $\Rightarrow$ (i) Suppose Condition (ii) holds. Then, by Corollary 1880, $\mathcal{I}$ is B -directional, with witnessing transformations β . Thus, by Theorem 1890, it is B -order monotone and has an order Leibniz B -quasicore. Moreover, by Proposition 1891, $\mathcal{I}$ is B -truth inequational and, therefore, by Theorem 1906, it is B -c-reflective and has an order adequate B -order core. Finally, taking into account Theorem 1865, we may apply Theorem 1909 to establish that $\leq^B$ is antisymmetric on $\{T : \langle \mathcal{A}, T \rangle \in \text{MatFam}^*(\mathcal{I})\}$. ■

Corollary 1911 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}^b$ in N^b , having two distinguished arguments, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$ and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$, such that, for all σ^b, τ^b in N^b , all $\Sigma \in |\mathbf{Sign}^b|$, all $\phi, \psi, \bar{\chi} \in \mathbf{SEN}^b(\Sigma)$:*

1. $\beta_\Sigma[\phi, \phi] \leq \text{Thm}(\mathcal{I})$;

2. $\sigma_\Sigma(\psi, \vec{\chi}) \in C_\Sigma(\beta_\Sigma[\phi, \psi], \sigma_\Sigma^b(\phi, \vec{\chi}))$, if $\sigma^b \in M^+$;
3. $\sigma_\Sigma(\phi, \vec{\chi}) \in C_\Sigma(\beta_\Sigma[\phi, \psi], \sigma_\Sigma^b(\psi, \vec{\chi}))$, if $\sigma^b \in M^-$;
4. $\beta_\Sigma[\sigma_\Sigma^b(\psi, \vec{\chi}), \tau_\Sigma^b(\psi, \vec{\chi})] \leq C(\vec{\beta}_\Sigma[\phi, \psi], \beta_\Sigma[\sigma_\Sigma^b(\phi, \vec{\chi}), \tau_\Sigma^b(\phi, \vec{\chi})])$.

If, for all $\sigma^b \in \beta$, $\sigma^b(x, y, \vec{z}) \in M^-$ or $\sigma^b(y, x, \vec{z}) \in M^+$, then $\mathcal{I}$ is β -order algebraizable if and only if it is M -order injective and has an order adequate M -order core.

Proof: By Theorem 1909, it suffices to show that $\mathcal{I}$ is M -directional. But this follows from Theorem 1876. ■

25.8 Tonicity

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $\leq^{\mathcal{A}}$ a qosystem on $\mathcal{A}$. $\leq^{\mathcal{A}}$ is called an M -order if, for all σ^b in N^b , $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi, \vec{\chi} \in \mathbf{SEN}(\Sigma)$,

- if $\sigma^b \in M^+$, then $\phi \leq_\Sigma^{\mathcal{A}} \psi$ implies $\sigma_\Sigma^{\mathcal{A}}(\phi, \vec{\chi}) \leq_\Sigma^{\mathcal{A}} \sigma_\Sigma^{\mathcal{A}}(\psi, \vec{\chi})$;
- if $\sigma^b \in M^-$, then $\phi \leq_\Sigma^{\mathcal{A}} \psi$ implies $\sigma_\Sigma^{\mathcal{A}}(\psi, \vec{\chi}) \leq_\Sigma^{\mathcal{A}} \sigma_\Sigma^{\mathcal{A}}(\phi, \vec{\chi})$.

In a way similar to the proof of the existence of $\leq^{M, \mathcal{A}}(T)$ in Proposition 1869, we can also show that, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \mathbf{SenFam}(\mathcal{A})$, there always exists a largest M -order on $\mathcal{A}$, such that T is upward closed, i.e., for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$,

$$\phi \in T_\Sigma \quad \text{and} \quad \phi \leq_\Sigma^{M, \mathcal{A}} \psi \quad \text{imply} \quad \psi \in T_\Sigma.$$

Proposition 1912 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \mathbf{SenFam}(\mathcal{A})$, there exists a largest M -order on $\mathcal{A}$, such that T is upward closed.*

Proof: We consider the class $\mathbf{MOrd}^{\mathcal{A}}(T)$ of all M -orders on $\mathcal{A}$ with respect to which T is upward closed. We take the transitive closure of the union of all qosystems in $\mathbf{MOrd}^{\mathcal{A}}(T)$,

$$\text{tc}(\bigcup \mathbf{MOrd}^{\mathcal{A}}(T)) = \{\text{tc}_\Sigma(\bigcup \mathbf{MOrd}^{\mathcal{A}}(T))\}_{\Sigma \in |\mathbf{Sign}|}.$$

It suffices to show that this is also an M -order on $\mathcal{A}$ with respect to which T is upward closed. i.e., it is itself a member of $\mathbf{MOrd}^{\mathcal{A}}(T)$. It will then follow that it is its largest member.

It is clear by the definition that $\text{tr}(\bigcup \text{MOrd}^{\mathcal{A}}(T))$ is a qosystem on $\mathcal{A}$. So it suffices to show that it is an M -order with respect to which T is upward closed.

Suppose σ^b in M^+ , $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi, \bar{\chi} \in \text{SEN}(\Sigma)$, such that

$$\phi \text{ tr}_{\Sigma}(\bigcup \text{MOrd}^{\mathcal{A}}(T)) \psi.$$

Then, there exist $q^0, \dots, q^k \in \text{MOrd}^{\mathcal{A}}(T)$ and $\xi_1, \dots, \xi_k \in \text{SEN}(\Sigma)$, such that

$$\phi q_{\Sigma}^0 \xi_1 q_{\Sigma}^1 \xi_2 q_{\Sigma}^2 \dots q_{\Sigma}^{k-1} \xi_k q_{\Sigma}^k \psi.$$

Since $\phi q_{\Sigma}^0 \xi_1$ and $q^0 \in \text{MOrd}^{\mathcal{A}}(T)$, we get $\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) q_{\Sigma}^0 \sigma_{\Sigma}^{\mathcal{A}}(\xi_1, \bar{\chi})$. Since $\xi_1 q_{\Sigma}^1 \xi_2$ and $q^1 \in \text{MOrd}^{\mathcal{A}}(T)$, we get $\sigma_{\Sigma}^{\mathcal{A}}(\xi_1, \bar{\chi}) q_{\Sigma}^1 \sigma_{\Sigma}^{\mathcal{A}}(\xi_2, \bar{\chi})$. We move one step to the right at a time in a similar fashion until we obtain $\sigma_{\Sigma}^{\mathcal{A}}(\xi_k, \bar{\chi}) q_{\Sigma}^k \sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi})$. Thus, we obtain

$$\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) \text{ tr}_{\Sigma}(\bigcup \text{MOrd}^{\mathcal{A}}(T)) \sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi}).$$

A similar argument is used to handle the case of negative polarity for σ^b . This proves that $\text{tr}(\bigcup \text{MOrd}^{\mathcal{A}}(T))$ is also an M -order on $\mathcal{A}$.

Finally, suppose $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\phi \in T_{\Sigma}$ and

$$\phi \text{ tr}_{\Sigma}(\bigcup \text{MOrd}^{\mathcal{A}}(T)) \psi.$$

Then, there exist $q^0, \dots, q^k \in \text{MOrd}^{\mathcal{A}}(T)$ and $\xi_1, \dots, \xi_k \in \text{SEN}(\Sigma)$, such that

$$\phi q_{\Sigma}^0 \xi_1 q_{\Sigma}^1 \xi_2 q_{\Sigma}^2 \dots q_{\Sigma}^{k-1} \xi_k q_{\Sigma}^k \psi.$$

Since T is upward closed with respect to all elements in $\text{MOrd}^{\mathcal{A}}(T)$ and $\phi \in T_{\Sigma}$, we get $\xi_1 \in T_{\Sigma}$, then $\xi_2 \in T_{\Sigma}$, then $\dots$, until, in the last step, $\xi_k \in T_{\Sigma}$ implies $\psi \in T_{\Sigma}$. Therefore, T is also upward closed with respect to $\text{tr}_{\Sigma}(\bigcup \text{MOrd}^{\mathcal{A}}(T))$, showing that $\text{tr}_{\Sigma}(\bigcup \text{MOrd}^{\mathcal{A}}(T)) \in \text{MOrd}^{\mathcal{A}}(T)$, whence it is its largest element. $\blacksquare$

Given an $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and $T \in \text{SenFam}(\mathcal{A})$, the **Leibniz M -order** $\leq^{M, \mathcal{A}}(T)$ of $\langle \mathcal{A}, T \rangle$ is the largest M -order on $\mathcal{A}$, such that T is upward closed, whose existence is assured by Proposition 1912.

It turns out that the Leibniz M -order $\leq^{M, \mathcal{A}}(T)$ is included in the M -Leibniz qosystem $\leq^{M, \mathcal{A}}(T)$ of T on $\mathcal{A}$.

Proposition 1913 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \text{SenFam}(\mathcal{A})$,*

$$\leq^{M, \mathcal{A}}(T) \leq \leq^{M, \mathcal{A}}(T).$$

Proof: It suffices to show that, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \text{SenFam}(\mathcal{A})$, $\leq^{M, \mathcal{A}}(T)$ is M -compatible with T . To this end, let σ^b in N^b , $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi, \bar{\chi} \in \text{SEN}(\Sigma)$.

- Suppose $\sigma^b \in M^+$, $\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi$ and $\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) \in T_{\Sigma}$. Since $\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi$ and $\leq_{\Sigma}^{M, \mathcal{A}}(T)$ is an M -order, we get $\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) \leq \sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi})$. Hence, since $\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) \in T_{\Sigma}$ and T is upward closed with respect to $\leq_{\Sigma}^{M, \mathcal{A}}(T)$, we get $\sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi}) \in T_{\Sigma}$.
- Suppose $\sigma^b \in M^-$, $\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi$ and $\sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi}) \in T_{\Sigma}$. Since $\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi$ and $\leq_{\Sigma}^{M, \mathcal{A}}(T)$ is an M -order, we get $\sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi}) \leq \sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi})$. Hence, since $\sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi}) \in T_{\Sigma}$ and T is upward closed with respect to $\leq_{\Sigma}^{M, \mathcal{A}}(T)$, we get $\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) \in T_{\Sigma}$.

Thus, $\leq_{\Sigma}^{M, \mathcal{A}}(T)$ is M -compatible with T and, hence, by the maximality of $\leq_{\Sigma}^{M, \mathcal{A}}(T)$, $\leq_{\Sigma}^{M, \mathcal{A}}(T) \leq \leq_{\Sigma}^{M, \mathcal{A}}(T)$. ■

We finally provide sufficient conditions ensuring that the two orders on $\mathcal{A}$ associated with $\mathcal{I}$ -filter families T of a π -institution $\mathcal{I}$, $\leq_{\Sigma}^{M, \mathcal{A}}(T)$ and $\leq_{\Sigma}^{M, \mathcal{A}}(T)$, coincide.

Proposition 1914 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, with $\beta : (\mathbf{SEN}^b)^{\omega} \rightarrow \mathbf{SEN}^b$ in N^b having two distinguished arguments, $M = (M^+, M^-)$ a polarity for $\mathbf{F}$, such that $p^{1,0} \in M^+$, and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. Suppose $\mathcal{I}$ is M -directional, with witnessing transformations β , and that, for all σ in N^b , all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \bar{\chi} \in \mathbf{SEN}^b(\Sigma)$,*

- *if $\sigma^b \in M^+$, $\beta_{\Sigma}[\sigma_{\Sigma}^b(\phi, \bar{\chi}), \sigma_{\Sigma}^b(\psi, \bar{\chi})] \leq C(\beta_{\Sigma}[\phi, \psi])$;*
- *if $\sigma^b \in M^-$, $\beta_{\Sigma}[\sigma_{\Sigma}^b(\psi, \bar{\chi}), \sigma_{\Sigma}^b(\phi, \bar{\chi})] \leq C(\beta_{\Sigma}[\phi, \psi])$.*

Then, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$, $\leq_{\Sigma}^{M, \mathcal{A}}(T)$ is the largest M -order on $\mathcal{A}$ with respect to which T is upward closed, i.e., $\leq_{\Sigma}^{M, \mathcal{A}}(T) = \leq_{\Sigma}^{M, \mathcal{A}}(T)$.

Proof: Let $\mathcal{A}$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. We show that $\leq_{\Sigma}^{M, \mathcal{A}}(T)$ is an M -order on $\mathcal{A}$, with respect to which T is upward closed. Then, it will follow, by the maximality property of $\leq_{\Sigma}^{M, \mathcal{A}}(T)$, that $\leq_{\Sigma}^{M, \mathcal{A}}(T) \leq \leq_{\Sigma}^{M, \mathcal{A}}(T)$.

Let σ^b in N^b , $\Sigma \in |\mathbf{Sign}|$ and $\phi, \psi, \bar{\chi} \in \mathbf{SEN}(\Sigma)$.

- Suppose $\sigma^b \in M^+$ and $\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi$. Thus, by M -directionality of $\mathcal{I}$, $\beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T$, whence, by hypothesis, $\beta_{\Sigma}^{\mathcal{A}}[\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}), \sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi})] \leq T$. Thus, again by M -directionality, $\sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi}) \leq_{\Sigma}^{M, \mathcal{A}}(T) \sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi})$.
- Suppose $\sigma^b \in M^-$ and $\phi \leq_{\Sigma}^{M, \mathcal{A}}(T) \psi$. Thus, by M -directionality of $\mathcal{I}$, $\beta_{\Sigma}^{\mathcal{A}}[\phi, \psi] \leq T$, whence, by hypothesis, $\beta_{\Sigma}^{\mathcal{A}}[\sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi}), \sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi})] \leq T$. Thus, again by M -directionality, $\sigma_{\Sigma}^{\mathcal{A}}(\psi, \bar{\chi}) \leq_{\Sigma}^{M, \mathcal{A}}(T) \sigma_{\Sigma}^{\mathcal{A}}(\phi, \bar{\chi})$.

Thus, $\leq^{M,\mathcal{A}}(T)$ is an M -order on $\mathcal{A}$.

Finally, suppose $\phi \leq_{\Sigma}^{M,\mathcal{A}} \psi$ and $\phi \in T_{\Sigma}$. Then, since, by hypothesis, $p^{1,0} \in M^+$ and $\leq^{M,\mathcal{A}}(T)$ is M -compatible with T , we get $\psi \in T_{\Sigma}$. Therefore, $\leq^{M,\mathcal{A}}(T)$ is an M -order with respect to which T is upward closed. It now follows by the maximality of $\leq^{M,\mathcal{A}}(T)$, that $\leq^{M,\mathcal{A}}(T) \leq \leq^{M,\mathcal{A}}(T)$ and, hence, by Proposition 1913, that $\leq^{M,\mathcal{A}}(T) = \leq^{M,\mathcal{A}}(T)$. ■

Chapter 26

Gentzen π -Institutions

26.1 Gentzen π -Institutions Revisited

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathbf{A} = \langle \mathbf{Sign}, \mathbf{SEN}, N \rangle$ be an N^b -algebraic system, $\Sigma \in |\mathbf{Sign}|$ and $m, n \in \omega$. An $\langle m, n \rangle$ - Σ -sequent of $\mathbf{A}$ is an expression

$$\phi_0, \dots, \phi_{m-1} \triangleright_{\Sigma} \psi_0, \dots, \psi_{n-1},$$

abbreviated $\vec{\phi} \triangleright_{\Sigma} \vec{\psi}$, consisting of two finite (possibly empty) sequences $\vec{\phi}, \vec{\psi} \in \mathbf{SEN}(\Sigma)$. A $\langle 0, n \rangle$ - Σ -sequent $\emptyset \triangleright_{\Sigma} \vec{\psi}$ is abbreviated $\triangleright_{\Sigma} \vec{\psi}$.

Given $\Sigma, \Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and an $\langle m, n \rangle$ - Σ -sequent $\vec{\phi} \triangleright_{\Sigma} \vec{\psi}$, we write

$$\mathbf{SEN}(f)(\vec{\phi} \triangleright_{\Sigma} \vec{\psi}) := \mathbf{SEN}(f)(\vec{\phi}) \triangleright_{\Sigma'} \mathbf{SEN}(f)(\vec{\psi}),$$

where, as usual,

$$\begin{aligned} \mathbf{SEN}(f)(\vec{\phi}) &:= \langle \mathbf{SEN}(f)(\phi_0), \dots, \mathbf{SEN}(f)(\phi_{m-1}) \rangle, \\ \mathbf{SEN}(f)(\vec{\psi}) &:= \langle \mathbf{SEN}(f)(\psi_0), \dots, \mathbf{SEN}(f)(\psi_{n-1}) \rangle. \end{aligned}$$

Sometimes, we denote a Σ -sequent by $\phi := \vec{\phi}^0 \triangleright_{\Sigma} \vec{\phi}^1$ and a set of Σ -sequents by Φ . The notation for images under morphisms is then extended to sets of Σ -sequents by writing

$$\mathbf{SEN}(f)(\Phi) = \{\mathbf{SEN}(f)(\phi) : \phi \in \Phi\}.$$

A **trace** tr is a nonempty subset of $\omega \times \omega$. An $\langle m, n \rangle$ - Σ -sequent is a **tr**- Σ -sequent if $\langle m, n \rangle \in \text{tr}$. The collection of all **tr**- Σ -sequents of $\mathbf{A}$ is denoted by $\text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{A})$ and we set

$$\text{Seq}^{\text{tr}}(\mathbf{A}) = \{\text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{A})\}_{\Sigma \in |\mathbf{Sign}|}.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and tr be a given trace. A **Gentzen π -institution of trace tr** based on $\mathbf{F}$ consists of a closure system

$$G : \mathcal{P}\text{Seq}^{\text{tr}}(\mathbf{F}) \rightarrow \mathcal{P}\text{Seq}^{\text{tr}}(\mathbf{F}),$$

i.e., a collection of closure operators

$$G_{\Sigma} : \mathcal{P}\text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F}) \rightarrow \mathcal{P}\text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F}), \quad \Sigma \in |\mathbf{Sign}^b|,$$

that also satisfy structurality, that is, for all $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, and all $\Phi \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\mathbf{SEN}(f)(G_{\Sigma}(\Phi)) \subseteq G_{\Sigma'}(\mathbf{SEN}(f)(\Phi)).$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If, for some $\Sigma \in |\mathbf{Sign}^b|$,

$\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, such that $\phi \in G_{\Sigma}(\Phi)$, we say that $\langle \Phi, \phi \rangle$ is a Σ -rule of $\mathfrak{G}$ or a Σ -derivable rule of $\mathfrak{G}$, sometimes denoted

$$\frac{\Phi}{\phi}.$$

A Σ -rule of form $\langle \emptyset, \phi \rangle$ is called a Σ -derivable sequent or a Σ -theorem of $\mathfrak{G}$.

$\mathfrak{G}$ is **inconsistent** if all elements in $\text{Seq}^{\text{tr}}(\mathbf{F})$ are derivable sequents in $\mathfrak{G}$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G}^i = \langle \mathbf{F}, G^i \rangle$, $i \in I$, a collection of Gentzen π -institutions, all of trace tr , based on $\mathbf{F}$. Then

$$\bigcap_{i \in I} \mathfrak{G}^i = \langle \mathbf{F}, \bigcap_{i \in I} G^i \rangle,$$

defined, by setting, for all $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\left(\bigcap_{i \in I} G^i \right)_{\Sigma}(\Phi) = \bigcap_{i \in I} G_{\Sigma}^i(\Phi),$$

is also a Gentzen π -institution.

Therefore, given a family $\mathfrak{X} = \{\mathfrak{X}_{\Sigma}\}_{\Sigma \in |\mathbf{Sign}^b|}$ of rules, there is a smallest Gentzen π -institution $\mathfrak{G}^{\mathfrak{X}} = \langle \mathbf{F}, G^{\mathfrak{X}} \rangle$, such that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\langle \Phi, \phi \rangle \in \mathfrak{X}_{\Sigma}$,

$$\phi \in G_{\Sigma}^{\mathfrak{X}}(\Phi).$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution based on $\mathbf{F}$, with $\langle 0, 1 \rangle \in \text{tr}$. Consider

$$G^0 : \mathcal{P}\text{SEN} \rightarrow \mathcal{P}\text{SEN}$$

defined, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, by

$$\phi \in G_{\Sigma}^0(\Phi) \quad \text{iff} \quad \triangleright_{\Sigma} \phi \in G_{\Sigma}(\{\triangleright_{\Sigma} \psi : \psi \in \Phi\}).$$

Lemma 1915 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution based on $\mathbf{F}$, with $\langle 0, 1 \rangle \in \text{tr}$. $G^0 : \mathcal{P}\text{SEN}^b \rightarrow \mathcal{P}\text{SEN}^b$ is a closure system on $\mathbf{F}$.*

Proof: Suppose, first, that $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, such that $\phi \in \Phi$. Then, by the inflationarity of G , $\triangleright_{\Sigma} \phi \in G_{\Sigma}(\{\triangleright_{\Sigma} \psi : \psi \in \Phi\})$ and, hence, by definition of G^0 , $\phi \in G_{\Sigma}^0(\Phi)$. Suppose, next, that $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \Psi \subseteq \text{SEN}^b(\Sigma)$, such that $\Phi \subseteq \Psi$. Then, by monotonicity of G , $G_{\Sigma}(\{\triangleright_{\Sigma} \phi : \phi \in \Phi\}) \subseteq G_{\Sigma}(\{\triangleright_{\Sigma} \psi : \psi \in \Psi\})$, whence, by the definition of G^0 , $G_{\Sigma}^0(\Phi) \subseteq G_{\Sigma}^0(\Psi)$. Now assume that $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$, such that $\phi \in G_{\Sigma}^0(G_{\Sigma}^0(\Phi))$. Then, taking into account the idempotency of G , we get

$$\begin{aligned} \triangleright_{\Sigma} \phi &\in G_{\Sigma}(\{\triangleright_{\Sigma} \psi : \psi \in G_{\Sigma}^0(\Phi)\}) \\ &\subseteq G_{\Sigma}(G_{\Sigma}(\{\triangleright_{\Sigma} \phi : \phi \in \Phi\})) \\ &\subseteq G_{\Sigma}(\{\triangleright_{\Sigma} \phi : \phi \in \Phi\}), \end{aligned}$$

whence $\phi \in G_\Sigma^0(\Phi)$. Finally, the structurality property of G^0 follows directly by the structurality property of G . $\blacksquare$

According to Lemma 1915, the structure $\mathcal{G}^0 = \langle \mathbf{F}, G^0 \rangle$ is a π -institution, called the π -**institution reduct** of the Gentzen π -institution $\mathfrak{G}$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems. Recall the closure system $C^K : \mathcal{P}(\text{SEN}^b)^2 \rightarrow \mathcal{P}(\text{SEN}^b)^2$ defined, by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $E \cup \{\phi \approx \psi\} \subseteq \text{SEN}^b(\Sigma)^2$,

$$\begin{aligned} \phi \approx \psi \in C_\Sigma^K(E) \quad \text{iff} \quad & \text{for all } \mathcal{A} \in \mathbf{K}, \Sigma' \in |\mathbf{Sign}^b|, f \in \mathbf{Sign}(\Sigma, \Sigma'), \\ & \alpha_{\Sigma'}(\text{SEN}^b(f)(E)) \subseteq \Delta_{F(\Sigma')}^A \\ & \text{implies } \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) = \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi)). \end{aligned}$$

The π -institution $\mathcal{I}^K = \langle \mathbf{F}, C^K \rangle$ was called the **equational π -institution associated with** the class $\mathbf{K}$. This π -institution may be recast as a Gentzen π -institution of trace $\{\langle 1, 1 \rangle\}$. More precisely, we define the Gentzen π -institution $\mathfrak{G}^K = \langle \mathbf{F}, G^K \rangle$ by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\{\phi_i, \psi_i : i \in I\} \cup \{\phi, \psi\} \subseteq \text{SEN}^b(\Sigma)$,

$$\phi \triangleright_\Sigma \psi \in G_\Sigma^K(\{\phi_i \triangleright_\Sigma \psi_i : i \in I\}) \quad \text{iff} \quad \phi \approx \psi \in C_\Sigma^K(\{\phi_i \approx \psi_i : i \in I\}).$$

We call $\mathfrak{G}^K$ the **Gentzen π -institution associated with** the class $\mathbf{K}$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a π -institution based on $\mathbf{F}$. $\mathcal{I}$ may also be recast as a Gentzen π -institution of trace $\{\langle 0, 1 \rangle\}$. More precisely, given $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \subseteq \text{SEN}^b(\Sigma)$, denote by

$$\triangleright_\Sigma \Phi = \{\triangleright_\Sigma \phi : \phi \in \Phi\}$$

and, similarly, given $T = \{T_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|} \in \text{SenFam}(\mathbf{F})$, let

$$\triangleright T = \{\triangleright_\Sigma T_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}.$$

We define $\mathfrak{G}^{\mathcal{I}} = \langle \mathbf{F}, G^{\mathcal{I}} \rangle$ by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{SEN}^b(\Sigma)$,

$$\triangleright_\Sigma \phi \in G_\Sigma^{\mathcal{I}}(\triangleright_\Sigma \Phi) \quad \text{iff} \quad \phi \in C_\Sigma(\Phi).$$

We call $\mathfrak{G}^{\mathcal{I}}$ the **Hilbert π -institution associated with** $\mathcal{I}$. In this terminology, a Hilbert π -institution is a Gentzen π -institution of trace $\{\langle 0, 1 \rangle\}$.

Given a Gentzen π -institution $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ of trace tr , such that $\langle 0, 1 \rangle \in \text{tr}$, we call the Hilbert π -institution $\mathfrak{G}^{\mathcal{G}^0}$ associated with the π -institution reduct $\mathcal{G}^0$ of $\mathfrak{G}$ the **Hilbert π -institution reduct of** $\mathfrak{G}$ and we denote it by $\mathfrak{G}^0 = \langle \mathbf{F}, G^0 \rangle$ (note the overloading of notation for G^0 , used both for the closure system of the π -institution $\mathcal{G}^0$ and for the closure system of $\mathfrak{G}^{\mathcal{G}^0}$; hopefully, this will not result into any confusion, since it should be resolvable based on context).

26.2 Equivalence of Gentzen π -Institutions

Let $\mathbf{F} = \langle \mathbf{Sign}, \mathbf{SEN}, N \rangle$, $\mathbf{F}' = \langle \mathbf{Sign}', \mathbf{SEN}', N' \rangle$ be algebraic systems and tr , tr' be traces. A tr - tr' -**translation** is a collection of functions

$$\alpha = \{\alpha^{m,n} : \langle m, n \rangle \in \text{tr}\},$$

where, for all $\langle m, n \rangle \in \text{tr}$,

$$\alpha^{m,n} = \{\alpha_\Sigma^{m,n}\}_{\Sigma \in |\mathbf{Sign}|}$$

is such that, for all $\Sigma \in |\mathbf{Sign}|$,

$$\alpha_\Sigma^{m,n} : \mathbf{SEN}(\Sigma)^{m,n} \rightarrow \mathcal{P}(\text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F}'))$$

assigns to each $\langle m, n \rangle$ - Σ -sequent $\vec{\phi} \triangleright_\Sigma \vec{\psi}$ of $\mathbf{F}$ a set of tr' - Σ -sequents of $\mathbf{F}'$

$$\alpha_\Sigma^{m,n}[\vec{\phi}; \vec{\psi}].$$

We extend the notation in a natural way in order to write expressions more concisely. Thus, given $\Sigma \in |\mathbf{Sign}|$ and $\Phi \cup \{\phi\} \subseteq \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, we set

$$\alpha_\Sigma[\phi] = \alpha_\Sigma[\vec{\phi}; \vec{\psi}],$$

if $\phi = \vec{\phi} \triangleright_\Sigma \vec{\psi}$, and

$$\alpha_\Sigma[\Phi] = \bigcup \{\alpha_\Sigma^{m,n}[\phi] : \phi \in \Phi^{m,n}, \langle m, n \rangle \in \text{tr}\}.$$

Finally, if $\Phi = \{\Phi_\Sigma\}_{\Sigma \in |\mathbf{Sign}|} \leq \text{Seq}^{\text{tr}}(\mathbf{F})$, we set

$$\alpha[\Phi] = \bigcup \{\alpha_\Sigma[\Phi_\Sigma] : \Sigma \in |\mathbf{Sign}|\}.$$

Even though we defined translations in a very general way, we will deal almost exclusively with a special kind of translation, called a **transformation**. To introduce those, we fix $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ and two traces tr and tr' . A tr - tr' -translation $\alpha = \{\alpha^{m,n} : \langle m, n \rangle \in \text{tr}\}$ is called a tr - tr' -**transformation** if there exists a family

$$\tau = \{\tau^{m,n} : \langle m, n \rangle \in \text{tr}\},$$

such that, for all $\langle m, n \rangle \in \text{tr}$,

$$\tau^{m,n} : \mathbf{SEN}^\omega \rightarrow \bigcup \{\mathbf{SEN}^{k+\ell} : \langle k, \ell \rangle \in \text{tr}'\}$$

is a collection of natural transformations in N^b , with $m + n$ distinguished arguments, such that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\vec{\phi} \triangleright_\Sigma \vec{\psi} \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\alpha_\Sigma^{m,n}[\vec{\phi}; \vec{\psi}] = \tau_\Sigma^{m,n}[\vec{\phi}; \vec{\psi}],$$

where, we let $\tau_\Sigma^{m,n}[\vec{\phi}; \vec{\psi}]$ be defined, for all $\Sigma' \in |\mathbf{Sign}^b|$, by

$$\tau_\Sigma^{m,n}[\vec{\phi}; \vec{\psi}] = \bigcup \{ \tau_\Sigma^{m,n}(\vec{\phi}, \vec{\psi}, \vec{\chi}) : \vec{\chi}' \in \text{SEN}^b(\Sigma) \}.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr and tr' two traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ and $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ two Gentzen π -institutions of traces tr and tr' , respectively, both based on $\mathbf{F}$. A tr - tr' -transformation τ is an **interpretation from $\mathfrak{G}$ to $\mathfrak{G}'$** , written $\tau : \mathfrak{G} \rightarrow \mathfrak{G}'$ if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$,

$$\phi \in G_\Sigma(\Phi) \quad \text{iff} \quad \tau_\Sigma[\phi] \subseteq G'_\Sigma(\tau_\Sigma[\Phi]).$$

The two π -institutions $\mathfrak{G}$ and $\mathfrak{G}'$ are **equivalent** if there exist a tr - tr' -transformation τ and a tr' - tr -transformation ρ , such that:

- $\tau : \mathfrak{G} \rightarrow \mathfrak{G}'$ is an interpretation;
- $\rho : \mathfrak{G}' \rightarrow \mathfrak{G}$ is an interpretation;
- for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$,

$$G_\Sigma(\phi) = G_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]]);$$

- for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi' \in \text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F})$,

$$G'_\Sigma(\phi') = G'_\Sigma(\tau_\Sigma[\rho_\Sigma[\phi']]).$$

In this case the pair (τ, ρ) is called a **conjugate pair** of transformations and denoted by $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$.

As in Lemma 892, it suffices to check only the first and last conditions, or, equivalently, the middle two conditions to ensure that two Gentzen π -institutions are equivalent.

Lemma 1916 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' be traces, $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ two Gentzen π -institutions of traces tr , tr' , respectively, based on $\mathbf{F}$, τ a tr - tr' -transformation and ρ a tr' - tr -transformation. The following are equivalent:*

- (i) $\tau : \mathfrak{G} \rightarrow \mathfrak{G}'$ is an interpretation and, for all $\Sigma \in |\mathbf{Sign}^b|$, $\phi' \in \text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F})$,
 $G'_\Sigma(\phi') = G'_\Sigma(\tau_\Sigma[\rho_\Sigma[\phi']]);$
- (ii) $\rho : \mathfrak{G}' \rightarrow \mathfrak{G}$ is an interpretation and, for all $\Sigma \in |\mathbf{Sign}^b|$, $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$,
 $G_\Sigma(\phi) = G_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]]).$

Proof: Similar to the proof of Lemma 892. Suppose that the conditions in (i) hold. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi' \cup \{\phi'\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}'}(\mathbf{F})$, we have

$$\begin{aligned} \phi' \in G'_{\Sigma}(\Phi') & \text{ iff } \tau_{\Sigma}[\rho_{\Sigma}[\phi']] \subseteq G'_{\Sigma}(\tau_{\Sigma}[\rho_{\Sigma}[\Phi']]) \\ & \text{ iff } \rho_{\Sigma}[\phi'] \subseteq G_{\Sigma}(\rho_{\Sigma}[\Phi']). \end{aligned}$$

Hence, $\rho : \mathfrak{G}' \rightarrow \mathfrak{G}$ is also an interpretation. Finally, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, we get, for all $\psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\begin{aligned} \psi \in G_{\Sigma}(\phi) & \text{ iff } \tau_{\Sigma}[\psi] \subseteq G'_{\Sigma}(\tau_{\Sigma}[\phi]) \\ & \text{ iff } \tau_{\Sigma}[\psi] \subseteq G_{\Sigma}(\tau_{\Sigma}[\rho_{\Sigma}[\tau_{\Sigma}[\phi]]]) \\ & \text{ iff } \psi \in G_{\Sigma}(\rho_{\Sigma}[\tau_{\Sigma}[\phi]]). \end{aligned}$$

Thus, the second condition of (ii) is also satisfied. Thus (i) implies (ii) holds and, by symmetry, we conclude that (i) and (ii) are equivalent. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' traces and τ a tr - tr' -transformation. Define

$$\tau^* : \text{SenFam}(\text{Seq}^{\text{tr}'}(\mathbf{F})) \rightarrow \text{SenFam}(\text{Seq}^{\text{tr}}(\mathbf{F}))$$

by setting, for all $\Phi' \in \text{SenFam}(\text{Seq}^{\text{tr}'}(\mathbf{F}))$,

$$\tau^*(\Phi') = \{\tau_{\Sigma}^*(\Phi')\}_{\Sigma \in |\mathbf{Sign}^b|}$$

be given, for all $\Sigma \in |\mathbf{Sign}^b|$, by

$$\tau_{\Sigma}^*(\Phi') = \{\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F}) : \tau_{\Sigma}[\phi] \subseteq \Phi'_{\Sigma}\}.$$

Analogously to Theorem 896, we can show that, if $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent Gentzen π -institutions via a conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$, then $\rho^* : \mathbf{ThFam}(\mathfrak{G}) \rightarrow \mathbf{ThFam}(\mathfrak{G}')$ and $\tau^* : \mathbf{ThFam}(\mathfrak{G}') \rightarrow \mathbf{ThFam}(\mathfrak{G})$ form a pair of mutually inverse order isomorphisms between the complete lattices of the corresponding theory families.

Theorem 1917 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' traces, $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr , tr' , respectively, and $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$ a conjugate pair of transformations. Then*

$$\rho^* : \mathbf{ThFam}(\mathfrak{G}) \rightarrow \mathbf{ThFam}(\mathfrak{G}') \quad \text{and} \quad \tau^* : \mathbf{ThFam}(\mathfrak{G}') \rightarrow \mathbf{ThFam}(\mathfrak{G})$$

are mutually inverse order isomorphisms.

Proof: Similar to the proof of Theorem 896. Let $T \in \mathbf{ThFam}(\mathfrak{G})$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, we get

$$\begin{aligned} \phi \in \tau_{\Sigma}^*(\rho^*(T)) & \text{ iff } \tau_{\Sigma}[\phi] \subseteq \rho_{\Sigma}^*(T) \\ & \text{ iff } \rho_{\Sigma}[\tau_{\Sigma}[\phi]] \subseteq T_{\Sigma} \\ & \text{ iff } \phi \in T_{\Sigma}. \end{aligned}$$

Thus, $\tau^*(\rho^*(\mathbf{T})) = \mathbf{T}$. By symmetry, for all $\mathbf{T}' \in \mathbf{ThFam}(\mathfrak{G}')$, $\rho^*(\tau^*(\mathbf{T}')) = \mathbf{T}'$. Thus, ρ^* and τ^* are mutually inverse bijections and, since they are both order preserving, they form a pair of mutually inverse order isomorphisms between $\mathbf{ThFam}(\mathfrak{G})$ and $\mathbf{ThFam}(\mathfrak{G}')$. ■

Conversely, it is true that, under certain hypotheses, given mutually inverse order isomorphisms between the complete lattices of two Gentzen π -institutions, one may define a conjugate pair between the two that establishes the order-isomorphism via the process that was described above.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' be traces, and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ be Gentzen π -institutions of traces tr , tr' , respectively, based on $\mathbf{F}$. Consider an order isomorphism

$$h : \mathbf{ThFam}(\mathfrak{G}') \rightarrow \mathbf{ThFam}(\mathfrak{G})$$

between the corresponding complete lattices of theory families.

Define $\vec{h} = \{ \vec{h}_\Sigma \}_{\Sigma \in |\mathbf{Sign}^b|}$ by letting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\vec{h}_\Sigma : \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F}) \rightarrow \mathcal{P}(\text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F}))$$

be given, for all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, by

$$\vec{h}_\Sigma[\phi] = h_\Sigma^{-1}(G(\phi)).$$

Further, define $\overleftarrow{h} = \{ \overleftarrow{h}_\Sigma \}_{\Sigma \in |\mathbf{Sign}^b|}$ by letting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$\overleftarrow{h}_\Sigma : \text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F}) \rightarrow \mathcal{P}(\text{Seq}_\Sigma^{\text{tr}}(\mathbf{F}))$$

be given, for all $\phi' \in \text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F})$, by

$$\overleftarrow{h}_\Sigma[\phi'] = h_\Sigma(G'(\phi')).$$

The order isomorphism $h : \mathbf{ThFam}(\mathfrak{G}') \rightarrow \mathbf{ThFam}(\mathfrak{G})$ is called **transformational** if there exist

- a tr - tr' -translation τ ,
- a tr' - tr -translation ρ ,

such that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ and all $\phi' \in \text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F})$,

$$\vec{h}_\Sigma[\phi] = G'_\Sigma(\tau_\Sigma[\phi]) \quad \text{and} \quad \overleftarrow{h}_\Sigma[\phi'] = G_\Sigma(\rho_\Sigma[\phi']),$$

i.e., by definition of $\vec{h}$ and $\overleftarrow{h}$, if and only if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ and all $\phi' \in \text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F})$,

$$h_\Sigma^{-1}(G(\phi)) = G'_\Sigma(\tau_\Sigma[\phi]) \quad \text{and} \quad h_\Sigma(G'(\phi')) = G_\Sigma(\rho_\Sigma[\phi']).$$

Here $G(\phi)$ and $G'(\phi')$ denote the theory families of $\mathfrak{G}$ and $\mathfrak{G}'$ generated by the Σ -sequents ϕ and ϕ' , respectively. Since all components of these theory families other than the Σ -components consist of sets of theorems, we sometimes write by a slight abuse of notation

$$h_{\Sigma}^{-1}(G_{\Sigma}(\phi)) = G'_{\Sigma}(\tau_{\Sigma}[\phi]) \quad \text{and} \quad h_{\Sigma}(G'_{\Sigma}(\phi')) = G_{\Sigma}(\rho_{\Sigma}[\phi']).$$

In this case, we say that h is **induced** by the pair of translations (τ, ρ) .

We can show that the properties defining transformationality of an order isomorphism extend to sets of Σ -sequents.

Lemma 1918 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' be traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr, tr' , respectively, based on $\mathbf{F}$. If $h : \mathbf{ThFam}(\mathfrak{G}') \rightarrow \mathbf{ThFam}(\mathfrak{G})$ a transformational order isomorphism induced by the pair (τ, ρ) of translations, then, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\Phi \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ and all $\Phi' \subseteq \text{Seq}_{\Sigma}^{\text{tr}'}(\mathbf{F})$,*

$$h_{\Sigma}^{-1}(G(\Phi)) = G'_{\Sigma}(\tau_{\Sigma}[\Phi]) \quad \text{and} \quad h_{\Sigma}(G'(\Phi')) = G_{\Sigma}(\rho_{\Sigma}[\Phi']).$$

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$, and $\Phi \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$. Then, taking into account that both $\mathbf{ThFam}(\mathfrak{G})$ and $\mathbf{ThFam}(\mathfrak{G}')$ are ordered signature-wise, we have

$$\begin{aligned} h_{\Sigma}^{-1}(G(\Phi)) &= h_{\Sigma}^{-1}(\bigvee_{\phi \in \Phi} G(\phi)) \\ &= \bigvee_{\phi \in \Phi} h_{\Sigma}^{-1}(G(\phi)) \\ &= \bigvee_{\phi \in \Phi} G'_{\Sigma}(\tau_{\Sigma}[\phi]) \\ &= G'_{\Sigma}(\bigcup_{\phi \in \Phi} \tau_{\Sigma}[\phi]) \\ &= G'_{\Sigma}(\tau_{\Sigma}[\Phi]). \end{aligned}$$

The second equality holds by symmetry. ■

Then the following result forms an analog of Theorem 903.

Theorem 1919 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' be traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr, tr' , respectively, based on $\mathbf{F}$. If $h : \mathbf{ThFam}(\mathfrak{G}') \rightarrow \mathbf{ThFam}(\mathfrak{G})$ a transformational order isomorphism induced by the pair (τ, ρ) of translations, then $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$ is a conjugate pair of transformations.*

Proof: Similar to the proof of Theorem 903. Suppose $h : \mathbf{ThFam}(\mathfrak{G}') \rightarrow \mathbf{ThFam}(\mathfrak{G})$ is an order isomorphism and let $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi' \cup \{\phi'\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}'}(\mathfrak{G}')$. Then we have

$$\begin{aligned} \phi' \in G'_{\Sigma}(\Phi') &\text{ iff } G'_{\Sigma}(\phi') \subseteq G'_{\Sigma}(\Phi') \\ &\text{ iff } h_{\Sigma}(G'(\phi')) \subseteq h_{\Sigma}(G'(\Phi')) \\ &\text{ iff } G_{\Sigma}(\rho_{\Sigma}[\phi]) \subseteq G_{\Sigma}(\rho_{\Sigma}[\Phi]) \\ &\text{ iff } \rho_{\Sigma}[\phi] \subseteq G_{\Sigma}(\rho_{\Sigma}[\Phi]). \end{aligned}$$

Thus, $\rho : \mathfrak{G}' \rightarrow \mathfrak{G}$ is an interpretation. Furthermore, for all $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, we have

$$\begin{aligned} G_{\Sigma}(\rho_{\Sigma}[\tau_{\Sigma}[\phi]]) &= h_{\Sigma}(G'_{\Sigma}(\tau_{\Sigma}[\phi])) \\ &= h_{\Sigma}(h_{\Sigma}^{-1}(G_{\Sigma}(\phi))) \\ &= G_{\Sigma}(\phi). \end{aligned}$$

We conclude that $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$ is a conjugate pair. $\blacksquare$

Finally, we show that interpretations compose and the same holds for equivalences of Gentzen π -institutions.

Lemma 1920 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' , tr'' be traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$, $\mathfrak{G}'' = \langle \mathbf{F}, G'' \rangle$ be Gentzen π -institutions of traces tr , tr' , tr'' , respectively, based on $\mathbf{F}$.*

- (a) *If $\tau : \mathfrak{G} \rightarrow \mathfrak{G}'$ and $\tau' : \mathfrak{G}' \rightarrow \mathfrak{G}''$ are interpretations, then $\tau' \circ \tau : \mathfrak{G} \rightarrow \mathfrak{G}''$ is also an interpretation;*
- (b) *If $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$ and $(\tau', \rho') : \mathfrak{G}' \rightleftharpoons \mathfrak{G}''$ are conjugate pairs, then $(\tau' \circ \tau, \rho \circ \rho') : \mathfrak{G} \rightleftharpoons \mathfrak{G}''$ is also a conjugate pair.*

Proof:

- (a) Suppose $\tau : \mathfrak{G} \rightarrow \mathfrak{G}'$ and $\tau' : \mathfrak{G}' \rightarrow \mathfrak{G}''$ are interpretations. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, we get

$$\begin{aligned} \phi \in G_{\Sigma}(\Phi) &\text{ iff } \tau_{\Sigma}[\phi] \subseteq G'_{\Sigma}(\tau_{\Sigma}[\Phi]) \\ &\text{ iff } \tau'_{\Sigma}[\tau_{\Sigma}[\phi]] \subseteq G''_{\Sigma}(\tau'_{\Sigma}[\tau_{\Sigma}[\Phi]]). \end{aligned}$$

hence, $\tau' \circ \tau : \mathfrak{G} \rightarrow \mathfrak{G}''$ is also an interpretation.

- (b) Now suppose that $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$ and $(\tau', \rho') : \mathfrak{G}' \rightleftharpoons \mathfrak{G}''$ are conjugate pairs. Then, by Part (a), $\tau' \circ \tau : \mathfrak{G} \rightarrow \mathfrak{G}''$ is an interpretation. Moreover, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi'', \psi'' \in \text{Seq}_{\Sigma}^{\text{tr}''}(\mathbf{F})$, we have $\psi'' \in G''_{\Sigma}(\phi'')$ if and only if

$$\rho'_{\Sigma}[\psi''] \subseteq G'_{\Sigma}(\rho'_{\Sigma}[\phi'']) = G'_{\Sigma}(\tau_{\Sigma}[\rho_{\Sigma}[\rho'_{\Sigma}[\phi'']]]).$$

This holds if and only if

$$\tau'_{\Sigma}[\rho'_{\Sigma}[\psi'']] \subseteq G''_{\Sigma}(\tau'_{\Sigma}[\tau_{\Sigma}[\rho_{\Sigma}[\rho'_{\Sigma}[\phi'']]]).$$

Equivalently,

$$\psi'' \in G''_{\Sigma}(\tau'_{\Sigma}[\tau_{\Sigma}[\rho_{\Sigma}[\rho'_{\Sigma}[\phi'']]]).$$

We conclude that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi'' \in \text{Seq}_{\Sigma}^{\text{tr}''}(\mathbf{F})$,

$$G''_{\Sigma}(\phi'') = G''_{\Sigma}(\tau'_{\Sigma}[\tau_{\Sigma}[\rho_{\Sigma}[\rho'_{\Sigma}[\phi'']]]).$$

Therefore, by Lemma 1916, $(\tau' \circ \tau, \rho \circ \rho') : \mathfrak{G} \rightleftharpoons \mathfrak{G}''$ is also a conjugate pair. $\blacksquare$

26.3 Hilbertizability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution based on $\mathbf{F}$. $\mathfrak{G}$ is **Hilbertizable** if it is equivalent to a Hilbert π -institution based on $\mathbf{F}$. In other words, $\mathfrak{G}$ is Hilbertizable if there exists a Hilbert π -institution $\mathfrak{H} = \langle \mathbf{F}, H \rangle$, based on $\mathbf{F}$, and a conjugate pair of transformations $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{H}$.

We have the following proposition that follows directly from the relevant definitions.

Proposition 1921 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is Hilbertizable if and only if there exist:*

- (1) *A Hilbert π -institution $\mathfrak{H} = \langle \mathbf{F}, H \rangle$;*
- (2) *A collection $\rho : (\mathbf{SEN}^b)^\omega \rightarrow \bigcup_{\langle m, n \rangle \in \text{tr}} \mathbf{SEN}^{m+n}$ in N^b with a single distinguished argument;*
- (3) *A family $\tau = \{\tau^{m,n} : \langle m, n \rangle \in \text{tr}\}$, where, for all $\langle m, n \rangle \in \text{tr}$, the collection $\tau^{m,n} : (\mathbf{SEN}^b)^\omega \rightarrow \mathbf{SEN}$ in N^b has $m+n$ distinguished arguments;*

such that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$,

- (a) *$\phi \in G_{\Sigma}(\Phi)$ iff $\tau_{\Sigma}[\phi] \subseteq H_{\Sigma}(\tau_{\Sigma}[\Phi])$;*
- (b) *$H_{\Sigma}(\phi) = H_{\Sigma}(\tau_{\Sigma}[\rho_{\Sigma}[\phi]])$;*

or, equivalently, such that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

- (c) *$\triangleright_{\Sigma} \phi \in H_{\Sigma}(\triangleright_{\Sigma} \Phi)$ iff $\rho_{\Sigma}[\phi] \subseteq G_{\Sigma}(\rho_{\Sigma}[\Phi])$;*
- (d) *$G_{\Sigma}(\phi) = G_{\Sigma}(\rho_{\Sigma}[\tau_{\Sigma}[\phi]])$.*

Proof: This is a rephrasing of the definition of Hilbertizability using the conditions establishing an equivalence between two Gentzen π -institutions and taking into account Lemma 1916. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution and $\mathfrak{H} = \langle \mathbf{F}, H \rangle$ a Hilbert π -institution both based on $\mathbf{F}$. Define the $\{\{0, 1\}\}$ -tr-transformation ρ^0 by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{SEN}^b(\Sigma)$,

$$\rho_{\Sigma}^0[\phi] = \{\triangleright_{\Sigma} \phi\}.$$

We say that $\mathfrak{G}$ and $\mathfrak{H}$ are **simply equivalent** if they are equivalent via a conjugate pair of the form $(\tau, \rho^0) : \mathfrak{G} \rightleftarrows \mathfrak{H}$. The Gentzen π -institution $\mathfrak{G}$ is **simply Hilbertizable** if it is simply equivalent to some Hilbert π -institution $\mathfrak{H} = \langle \mathbf{F}, H \rangle$.

If $\mathfrak{G}$ is simply Hilbertizable, it turns out that there is a unique Hilbert π -institution simply equivalent to $\mathfrak{G}$, namely, the Hilbert π -institution reduct $\mathfrak{G}^0$ of $\mathfrak{G}$.

Proposition 1922 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution based on $\mathbf{F}$. If $\mathfrak{G}$ is simply Hilbertizable, then it is simply equivalent to a unique Hilbert π -institution, namely, the Hilbert π -institution reduct $\mathfrak{G}^0 = \langle \mathbf{F}, G^0 \rangle$ of $\mathfrak{G}$.*

Proof: Suppose that $\mathfrak{G}$ is simply Hilbertizable via the conjugate pair $(\tau, \rho^0) : \mathfrak{G} \rightarrow \mathfrak{H}$, with $\mathfrak{H} = \langle \mathbf{F}, H \rangle$. It suffices to show that $H = G^0$. To this end, let $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$. Then we have

$$\begin{aligned} \triangleright_{\Sigma} \phi \in H_{\Sigma}(\triangleright_{\Sigma} \Phi) & \text{ iff } \rho_{\Sigma}^0[\phi] \subseteq G_{\Sigma}(\rho_{\Sigma}^0[\Phi]) \quad (\text{by hypothesis}) \\ & \text{ iff } \triangleright_{\Sigma} \phi \in G_{\Sigma}(\triangleright_{\Sigma} \Phi) \quad (\text{definition of } \rho^0) \\ & \text{ iff } \triangleright_{\Sigma} \phi \in G_{\Sigma}^0(\triangleright_{\Sigma} \Phi). \quad (\text{definition of } G^0) \end{aligned}$$

Therefore $\mathfrak{H} = \mathfrak{G}^0$, whence it follows that $\mathfrak{G}$ is simply Hilbertizable via a simple equivalence involving the Hilbert π -institution reduct $\mathfrak{G}^0$ of $\mathfrak{G}$ ■

We have, further, the following simpler characterization of simple Hilbertizability, due to the fact that the interpretation in one of the two directions is required to be a fixed one.

Proposition 1923 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$, be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is simply Hilbertizable if and only if there exists a $\text{tr}\text{-}\{0, 1\}$ -transformation $\tau = \{\tau^{m,n} : \langle m, n \rangle \in \text{tr}\}$, such that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,*

$$G_{\Sigma}(\phi) = G_{\Sigma}(\triangleright \tau_{\Sigma}[\phi]).$$

Proof: If $\mathfrak{G}$ is simply Hilbertizable, then, by Proposition 1922, it is equivalent to the Hilbert π -institution reduct $\mathfrak{G}^0$ of $\mathfrak{G}$ via some conjugate pair $(\tau, \rho^0) : \mathfrak{G} \rightleftharpoons \mathfrak{G}^0$. Thus, by the definition of equivalence, we get, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\begin{aligned} G_{\Sigma}(\phi) &= G_{\Sigma}(\rho_{\Sigma}^0[\tau_{\Sigma}[\phi]]) \\ &= G_{\Sigma}(\triangleright_{\Sigma} \tau_{\Sigma}[\phi]). \end{aligned}$$

Assume, conversely, that there exists a $\text{tr}\text{-}\{0, 1\}$ -transformation τ , such that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, $G_{\Sigma}(\phi) = G_{\Sigma}(\triangleright \tau_{\Sigma}[\phi])$. To show that $\mathfrak{G}$ is simply Hilbertizable, it suffices, by Proposition 1922 and Proposition 1921, to show that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \mathbf{SEN}^b(\Sigma)$,

$$\triangleright_{\Sigma} \phi \in G_{\Sigma}^0(\triangleright_{\Sigma} \Phi) \quad \text{iff} \quad \triangleright_{\Sigma} \phi \in G_{\Sigma}(\triangleright_{\Sigma} \Phi).$$

This equivalence, however, holds by the definition of G^0 . ■

26.4 Syntactic WF Algebraizability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is (**syntactically WF**) **algebraizable** if it is equivalent to the Gentzen π -institution $\mathfrak{G}^K = \langle \mathbf{F}, G^K \rangle$ associated with some class K of $\mathbf{F}$ -algebraic systems.

Explicitly, using the definition of equivalence, this means that there exists a class K of $\mathbf{F}$ -algebraic systems, a tr - $\{\langle 1, 1 \rangle\}$ -transformation τ and a $\{\langle 1, 1 \rangle\}$ - tr -transformation ρ , such that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,

$$(a) \quad \phi \in G_{\Sigma}(\Phi) \text{ iff } \tau_{\Sigma}[\phi] \subseteq G_{\Sigma}^K(\tau_{\Sigma}[\Phi]);$$

$$(b) \quad G_{\Sigma}^K(\phi \triangleright_{\Sigma} \psi) = G_{\Sigma}^K(\tau_{\Sigma}[\rho_{\Sigma}[\phi; \psi]]);$$

or, equivalently, such that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $E \cup \{\phi \approx \psi\} \subseteq \text{Eq}_{\Sigma}(\mathbf{F})$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$(c) \quad \phi \triangleright_{\Sigma} \psi \in G_{\Sigma}^K(E) \text{ iff } \rho_{\Sigma}[\phi; \psi] \subseteq G_{\Sigma}(\rho_{\Sigma}[E]);$$

$$(d) \quad G_{\Sigma}(\phi) = G_{\Sigma}(\rho_{\Sigma}[\tau_{\Sigma}[\phi]]).$$

Recall that, given a class K of $\mathbf{F}$ -algebraic systems, we denote by $\mathbf{G}(K)$, the quasivariety of $\mathbf{F}$ -algebraic systems generated by K , i.e., the collection of all $\mathbf{F}$ -algebraic systems that satisfy the $\mathbf{F}$ -guasiequations that are satisfied by all $\mathcal{A} \in K$.

It turns out that, when a Gentzen π -institution $\mathfrak{G}$ is algebraizable via two different classes K and K' of $\mathbf{F}$ -algebraic systems, then both classes K and K' generate the same quasivariety and, hence, that there exists a unique quasivariety of $\mathbf{F}$ -algebraic systems that serves as the algebraizing class of $\mathfrak{G}$. This is proven in Proposition 1925, following a needed lemma.

Lemma 1924 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is algebraizable via $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle \in \text{tr}$,*

$$\psi \in G_{\Sigma}(\{\phi\} \cup \bigcup \{\rho_{\Sigma}[\phi_i; \psi_i] : i < m + n\}).$$

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle \in \text{tr}$. By the definition of an equational Gentzen π -institution, we get

$$\tau_{\Sigma}[\psi] \subseteq G_{\Sigma}^K(\tau_{\Sigma}[\phi] \cup \{\phi_i \triangleright_{\Sigma} \psi_i : i < m + n\}).$$

Thus, since, by the definition of equivalence

$$G_{\Sigma}^K(\phi_i \triangleright_{\Sigma} \psi_i) = G_{\Sigma}^K(\tau_{\Sigma}[\rho_{\Sigma}[\phi_i; \psi_i]]),$$

we get that

$$\tau_\Sigma[\psi] \subseteq G_\Sigma^K(\tau_\Sigma[\phi] \cup \bigcup \{\tau_\Sigma[\rho_\Sigma[\phi_i; \psi_i]] : i < m + n\}).$$

Therefore, since τ is an interpretation,

$$\psi \in G_\Sigma(\{\phi\} \cup \bigcup \{\rho_\Sigma[\phi_i; \psi_i] : i < m + n\}).$$

This establishes the conclusion. $\blacksquare$

Proposition 1925 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is algebraizable via both the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$ of transformations and the conjugate pair $(\tau', \rho') : \mathfrak{G} \rightleftarrows \mathfrak{G}^{K'}$ of transformations, then $G(K) = G(K')$.*

Proof: Suppose that $\mathfrak{G}$ is algebraizable via both the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$ of transformations and the conjugate pair $(\tau', \rho') : \mathfrak{G} \rightleftarrows \mathfrak{G}^{K'}$ of transformations.

We show, first, that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,

$$G_\Sigma(\rho_\Sigma[\phi; \psi]) = G_\Sigma(\rho'_\Sigma[\phi; \psi]).$$

Note that $\rho'_\Sigma[\phi; \phi] \subseteq G_\Sigma(\emptyset)$, since $\phi \triangleright_\Sigma \phi \in G_\Sigma^{K'}(\emptyset)$ and $\rho' : \mathfrak{G}^{K'} \rightarrow \mathfrak{G}$ is an interpretation. Moreover, for all $\sigma \in \rho'$ of trace $\langle m, n \rangle \in \text{tr}$, all $i < m + n$, all $\Sigma \in |\mathbf{Sign}^b|$, and all $\tilde{\chi} \in \mathbf{SEN}^b(\Sigma)$,

$$\rho_\Sigma[\sigma_\Sigma^i(\phi, \phi, \tilde{\chi}); \sigma_\Sigma^i(\phi, \psi, \tilde{\chi})] \subseteq G_\Sigma(\rho_\Sigma[\phi; \psi]).$$

Since, by Lemma 1924, ρ has the modus ponens in $\mathfrak{G}$, we get that $\rho'_\Sigma[\phi; \psi] \subseteq G_\Sigma(\rho_\Sigma[\phi; \psi])$. By symmetry, we conclude that $G_\Sigma(\rho_\Sigma[\phi; \psi]) = G_\Sigma(\rho'_\Sigma[\phi; \psi])$.

Finally, we have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$,

$$\begin{aligned} \phi \triangleright_\Sigma \psi \in G_\Sigma^K(E) & \text{ iff } \rho_\Sigma[\phi; \psi] \subseteq G_\Sigma(\rho_\Sigma[E]) \\ & \text{ iff } \rho'_\Sigma[\phi; \psi] \subseteq G_\Sigma(\rho'_\Sigma[E]) \\ & \text{ iff } \phi \triangleright_\Sigma \psi \in G_\Sigma^{K'}(E). \end{aligned}$$

Thus, we get that $G(K) = G(K')$. $\blacksquare$

Given an algebraizable Gentzen π -institution $\mathfrak{G}$, there exists, by Proposition 1925, a unique quasivariety K that serves as the algebraic counterpart of $\mathfrak{G}$. It is called the **equivalent algebraic semantics of $\mathfrak{G}$** .

The next result asserts that equivalent Gentzen systems have the same status vis-à-vis algebraizability and, in case they are algebraizable, they share a common algebraic semantics. Moreover, they share the same Hilbertizability status and, in case they are Hilbertizable, they share the same Hilbertizations (which, however, are not unique).

Proposition 1926 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ two equivalent Gentzen π -institutions of traces tr, tr' , respectively, based on $\mathbf{F}$.*

- (a) *$\mathfrak{G}$ is algebraizable if and only if $\mathfrak{G}'$ is algebraizable. If this is the case, $\mathfrak{G}$ and $\mathfrak{G}'$ have the same algebraic semantics.*
- (b) *$\mathfrak{G}$ is Hilbertizable if and only if $\mathfrak{G}'$ is Hilbertizable. If this is the case, every Hilbertization of $\mathfrak{G}$ is one of $\mathfrak{G}'$ also.*

Proof:

- (a) Suppose $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$ and that $\mathfrak{G}'$ is algebraizable via $(\tau', \rho') : \mathfrak{G}' \rightleftarrows \mathfrak{G}^{K'}$, for some class K' of $\mathbf{F}$ -algebraic systems. Then, by Lemma 1920,

$$\mathfrak{G} \begin{array}{c} \xrightarrow{\tau} \\ \xleftarrow{\rho} \end{array} \mathfrak{G}' \begin{array}{c} \xrightarrow{\tau'} \\ \xleftarrow{\rho'} \end{array} \mathfrak{G}^{K'}$$

$(\tau' \circ \tau, \rho \circ \rho') : \mathfrak{G} \rightleftarrows \mathfrak{G}^{K'}$ is witnessing the algebraizability of $\mathfrak{G}$. By symmetry $\mathfrak{G}$ is algebraizable if and only if $\mathfrak{G}'$ is algebraizable. Since any algebraizing class K' for $\mathfrak{G}'$ is also an algebraizing class for $\mathfrak{G}$, and vice versa, we get that $\mathfrak{G}$ and $\mathfrak{G}'$ have the same equivalent algebraic semantics.

- (b) Suppose $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$ and that $\mathfrak{G}'$ is Hilbertizable via $(\tau', \rho') : \mathfrak{G}' \rightleftarrows \mathfrak{H}'$, for some Hilbert π -institution $\mathfrak{H}'$. Then, again by Lemma 1920,

$$\mathfrak{G} \begin{array}{c} \xrightarrow{\tau} \\ \xleftarrow{\rho} \end{array} \mathfrak{G}' \begin{array}{c} \xrightarrow{\tau'} \\ \xleftarrow{\rho'} \end{array} \mathfrak{H}'$$

$(\tau' \circ \tau, \rho \circ \rho') : \mathfrak{G} \rightleftarrows \mathfrak{H}'$ is witnessing the Hilbertizability of $\mathfrak{G}$. By symmetry, $\mathfrak{G}$ is Hilbertizable if and only if $\mathfrak{G}'$ is. Moreover, any Hilbertization $\mathfrak{H}'$ for $\mathfrak{G}'$ serves also as one for $\mathfrak{G}$, and vice versa, i.e., $\mathfrak{G}$ and $\mathfrak{G}'$ share the same Hilbertizations. ■

Suppose that a Gentzen π -institution $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ of trace tr , together with a trace tr' , are given. We give, next, a characterization of the existence of an equivalence $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$ of $\mathfrak{G}$ with some Gentzen π -institution $\mathfrak{G}'$, having the given trace tr' .

Theorem 1927 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' be traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is equivalent to a Gentzen π -institution $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ of trace tr' based on $\mathbf{F}$ if and only if there exist a tr - tr' -transformation τ and a tr' - tr -transformation ρ , such that:*

- (1) $\rho^* : \text{ThFam}(\mathfrak{G}) \rightarrow \text{SenFam}(\text{Seq}^{\text{tr}'}(\mathbf{F}))$ is injective on $\text{ThFam}(\mathfrak{G})$;
- (2) For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, $\rho_\Sigma^*(G(\phi)) = G'_\Sigma(\tau_\Sigma[\phi])$, where G' is the closure system induced by $\rho^*(\text{ThFam}(\mathfrak{G}))$.

Proof: Suppose, first, that there exists an equivalence $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$, where $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ is a Gentzen π -institution of trace tr' based on $\mathbf{F}$. By Theorem 1917, we know that $\rho^* : \text{ThFam}(\mathfrak{G}) \rightarrow \text{ThFam}(\mathfrak{G}')$ is an order isomorphism, whence, in particular, it is injective on $\text{ThFam}(\mathfrak{G})$. Moreover, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, we have

$$\begin{aligned} \psi \in \rho_\Sigma^*(G(\phi)) & \text{ iff } \rho_\Sigma[\psi] \subseteq G_\Sigma(\phi) \\ & \text{ iff } \tau_\Sigma[\rho_\Sigma[\psi]] \subseteq G'_\Sigma(\tau_\Sigma[\phi]) \\ & \text{ iff } \psi \in G'_\Sigma(\tau_\Sigma[\phi]). \end{aligned}$$

Therefore, $\rho_\Sigma^*(G(\phi)) = G'_\Sigma(\tau_\Sigma[\phi])$.

Suppose, conversely, that there exist a tr - tr' -transformation τ and a tr' - tr -transformation ρ , such that Conditions (1) and (2) of the statement hold. Since $\rho^*(\text{ThFam}(\mathfrak{G}))$ is closed under intersection, it defines a closure system on $\text{Seq}^{\text{tr}'}(\mathbf{F})$, which we denote by G' , writing $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ for the corresponding Gentzen π -institution of trace tr' . It suffices now, by Theorem 1919, to show that $\rho^* : \text{ThFam}(\mathfrak{G}) \rightarrow \text{ThFam}(\mathfrak{G}')$ is a transformational order isomorphism induced by (τ, ρ) . We know, by hypothesis, that ρ^* is injective. By definition of $\mathfrak{G}'$, it is surjective. By definition of ρ^* , it is order preserving. Finally, it is order reflecting, since, for all $\mathbf{T}, \mathbf{T}' \in \text{ThFam}(\mathfrak{G})$,

$$\begin{aligned} \rho^*(\mathbf{T}) \leq \rho^*(\mathbf{T}') & \text{ iff } \rho^*(\mathbf{T}) \cap \rho^*(\mathbf{T}') = \rho^*(\mathbf{T}) \\ & \text{ iff } \rho^*(\mathbf{T} \cap \mathbf{T}') = \rho^*(\mathbf{T}) \\ & \text{ iff } \mathbf{T} \cap \mathbf{T}' = \mathbf{T} \\ & \text{ iff } \mathbf{T} \leq \mathbf{T}'. \end{aligned}$$

Therefore, $\rho^* : \text{ThFam}(\mathfrak{G}) \rightarrow \text{ThFam}(\mathfrak{G}')$ is, indeed, an order isomorphism. To show that $\rho^* : \text{ThFam}(\mathfrak{G}) \rightarrow \text{ThFam}(\mathfrak{G}')$ is transformational, it suffices to show that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ and all $\phi' \in \text{Seq}_\Sigma^{\text{tr}'}(\mathbf{F})$,

$$\rho_\Sigma^*(G(\phi)) = G'_\Sigma(\tau_\Sigma[\phi]) \quad \text{and} \quad (\rho^*)_\Sigma^{-1}(G'(\phi')) = G_\Sigma(\rho_\Sigma[\phi']).$$

The first holds by hypothesis and the second holds by the definition of G' , since $\rho_\Sigma^*(G(\rho_\Sigma[\phi']))$ is the least theory family of $\mathfrak{G}'$ containing ϕ' . $\blacksquare$

26.5 Matrix Families and Algebraic Semantics

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$, an $\mathbf{F}$ -algebraic system. A **tr-filter family**

of $\mathcal{A}$ is a family $\mathbf{T} \leq \text{Seq}^{\text{tr}}(\mathcal{A})$. The pair $\mathfrak{A} = \langle \mathcal{A}, \mathbf{T} \rangle$ is called a **tr-matrix family**. It defines a closure family $G^{\mathfrak{A}}$ of trace tr on $\mathbf{F}$ as follows: For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\begin{aligned} \phi \in G_{\Sigma}^{\mathfrak{A}}(\Phi) \quad \text{iff} \quad & \text{for all } \Sigma' \in |\mathbf{Sign}^b|, f \in \mathbf{Sign}^b(\Sigma, \Sigma'), \\ \alpha_{\Sigma'}(\text{SEN}^b(f)(\Phi)) \subseteq \mathbf{T}_{F(\Sigma')} \quad & \text{implies } \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \in \mathbf{T}_{F(\Sigma')}. \end{aligned}$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. Let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$, be an $\mathbf{F}$ -algebraic system and $\mathbf{T}$ a tr-filter family of $\mathcal{A}$. $\mathbf{T}$ is called a **$\mathfrak{G}$ -filter family of $\mathcal{A}$** if $G \leq G^{\mathfrak{A}}$, i.e., if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\phi \in G_{\Sigma}(\Phi) \quad \text{implies} \quad \phi \in G_{\Sigma}^{\mathfrak{A}}(\Phi).$$

Note that, as was pointed out previously, because of the structurality of G , it suffices to check that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, such that $\phi \in G_{\Sigma}(\Phi)$, we have

$$\alpha_{\Sigma}(\Phi) \subseteq \mathbf{T}_{F(\Sigma)} \quad \text{implies} \quad \alpha_{\Sigma}(\phi) \in \mathbf{T}_{F(\Sigma)}.$$

If $\mathbf{T}$ is a $\mathfrak{G}$ -filter family of $\mathcal{A}$, then the pair $\mathfrak{A} = \langle \mathcal{A}, \mathbf{T} \rangle$ is called a **$\mathfrak{G}$ -matrix family of $\mathcal{A}$** . We denote by $\text{FiFam}^{\mathfrak{G}}(\mathcal{A})$ the collection of all $\mathfrak{G}$ -filter families of $\mathcal{A}$ and by $\text{MatFam}(\mathfrak{G})$ the collection of all $\mathfrak{G}$ -matrix families.

Many facts, introduced previously in this work, that hold for $\mathcal{I}$ -filter families and $\mathcal{I}$ -matrix families, for a π -institution $\mathcal{I}$, have analogs for $\mathfrak{G}$ -filter and $\mathfrak{G}$ -matrix families, respectively. We list some of those that will be needed in the sequel.

Lemma 1928 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$ and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ $\mathbf{F}$ -algebraic systems.*

(a) *The collection $\text{FiFam}^{\mathfrak{G}}(\mathcal{A})$ forms a complete lattice*

$$\mathbf{FiFam}^{\mathfrak{G}}(\mathcal{A}) = \langle \text{FiFam}^{\mathfrak{G}}(\mathcal{A}), \leq \rangle$$

under signature-wise inclusion $\leq$;

(b) $\text{FiFam}^{\mathfrak{G}}(\mathcal{F}) = \text{ThFam}(\mathfrak{G})$;

(c) *If $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$ are $\mathbf{F}$ -algebraic systems and $\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$ a surjective morphism, then $\mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{B})$ if and only if $\gamma^{-1}(\mathbf{T}) \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$.*

Proof:

- (a) Let $\{\mathbf{T}^i : i \in I\} \subseteq \text{FiFam}^\mathfrak{G}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\Phi \cup \{\phi\} \subseteq \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, such that $\phi \in G_\Sigma(\Phi)$. Then, if $\alpha_\Sigma(\Phi) \subseteq \bigcap_{i \in I} \mathbf{T}_{F(\Sigma)}^i$, we get $\alpha_\Sigma(\Phi) \subseteq \mathbf{T}_{F(\Sigma)}^i$, for all $i \in I$, whence, since $\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$, $\alpha_\Sigma(\phi) \in \mathbf{T}_{F(\Sigma)}^i$, for all $i \in I$, i.e., $\alpha_\Sigma(\phi) \in \bigcap_{i \in I} \mathbf{T}_{F(\Sigma)}^i$. We conclude that $\bigcap_{i \in I} \mathbf{T}^i \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$.
- (b) For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, such that $\phi \in G_\Sigma(\Phi)$, we get that, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Phi \subseteq \mathbf{T}_\Sigma$ implies $\phi \in \mathbf{T}_\Sigma$. Therefore, $\text{ThFam}(\mathfrak{G}) \subseteq \text{FiFam}^\mathfrak{G}(\mathcal{F})$. On the other hand, if $\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{F})$, then, if $\phi \in G_\Sigma(\mathbf{T}_\Sigma)$, then $\phi \in \mathbf{T}_\Sigma$, i.e., $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$. Therefore, $\text{FiFam}^\mathfrak{G}(\mathcal{F}) = \text{ThFam}(\mathfrak{G})$.
- (c) Assume, first, that $\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{B})$ and let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, such that $\phi \in G_\Sigma(\Phi)$ and $\alpha_\Sigma(\Phi) \subseteq \gamma_{F(\Sigma)}^{-1}(\mathbf{T}_{H(F(\Sigma))})$. Then

$$\begin{array}{ccc}
 & \mathcal{F} & \\
 \langle F, \alpha \rangle \swarrow & & \searrow \langle G, \beta \rangle \\
 \mathcal{A} & \xrightarrow{\langle H, \gamma \rangle} & \mathcal{B}
 \end{array}$$

$\gamma_{F(\Sigma)}(\alpha_\Sigma(\Phi)) \subseteq \mathbf{T}_{H(F(\Sigma))}$, i.e., $\beta_\Sigma(\Phi) \subseteq \mathbf{T}_{G(\Sigma)}$. Since $\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{B})$, we now get $\beta_\Sigma(\phi) \in \mathbf{T}_{G(\Sigma)}$. Reversing the steps above, we conclude that $\alpha_\Sigma(\phi) \in \gamma_{F(\Sigma)}^{-1}(\mathbf{T}_{H(F(\Sigma))})$. Therefore, $\gamma^{-1}(\mathbf{T}) \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$.

Assume, conversely, that $\gamma^{-1}(\mathbf{T}) \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$ and let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, such that $\phi \in G_\Sigma(\Phi)$ and $\beta_\Sigma(\Phi) \subseteq \mathbf{T}_{G(\Sigma)}$. Then $\gamma_{F(\Sigma)}(\alpha_\Sigma(\Phi)) \subseteq \mathbf{T}_{H(F(\Sigma))}$, whence $\alpha_\Sigma(\Phi) \subseteq \gamma_{F(\Sigma)}^{-1}(\mathbf{T}_{H(F(\Sigma))})$. Since $\gamma^{-1}(\mathbf{T}) \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$, we get $\alpha_\Sigma(\phi) \in \gamma_{F(\Sigma)}^{-1}(\mathbf{T}_{H(F(\Sigma))})$. Reversing, once more, the preceding steps, we get that $\beta_\Sigma(\phi) \in \mathbf{T}_{G(\Sigma)}$. Therefore, $\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{B})$. ■

The isomorphism between the complete lattices of theory families induced by an equivalence extends to corresponding order isomorphisms between the complete lattices of filter families of the equivalent Gentzen π -institutions on the same algebraic system.

Proposition 1929 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' be traces, and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ two Gentzen π -institutions of traces tr, tr' , respectively, based on $\mathbf{F}$. If $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$, then, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, the mappings*

$$\begin{aligned}
 T &\longmapsto \rho^{A^*}(T), & T &\in \text{FiFam}^\mathfrak{G}(\mathcal{A}), \\
 \tau^{A^*}(T') &\longleftarrow T', & T' &\in \text{FiFam}^{\mathfrak{G}'}(\mathcal{A}),
 \end{aligned}$$

are mutually inverse isomorphisms from $\text{FiFam}^\mathfrak{G}(\mathcal{A})$ onto $\text{FiFam}^{\mathfrak{G}'}(\mathcal{A})$.

Proof: We show, first, that, for all $\mathbf{T} \in \text{FiFam}^{\mathcal{G}}(\mathcal{A})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\rho_{F(\Sigma)}^{\mathcal{A}}[\tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_{\Sigma}(\phi)]] \subseteq \mathbf{T}_{F(\Sigma)} \quad \text{iff} \quad \alpha_{\Sigma}(\phi) \in \mathbf{T}_{F(\Sigma)}.$$

Indeed, taking into account the surjectivity of $\langle F, \alpha \rangle$, we obtain

$$\begin{aligned} \rho_{F(\Sigma)}^{\mathcal{A}}[\tau_{F(\Sigma)}^{\mathcal{A}}[\alpha_{\Sigma}(\phi)]] \subseteq \mathbf{T}_{F(\Sigma)} & \quad \text{iff} \quad \rho_{F(\Sigma)}^{\mathcal{A}}[\alpha_{\Sigma}(\tau_{\Sigma}[\phi])] \subseteq \mathbf{T}_{F(\Sigma)} \\ & \quad \text{iff} \quad \alpha_{\Sigma}(\rho_{\Sigma}[\tau_{\Sigma}[\phi]]) \subseteq \mathbf{T}_{F(\Sigma)} \\ & \quad \text{iff} \quad \rho_{\Sigma}[\tau_{\Sigma}[\phi]] \subseteq \alpha_{\Sigma}^{-1}(\mathbf{T}_{F(\Sigma)}) \\ & \quad \text{iff} \quad \phi \in \alpha_{\Sigma}^{-1}(\mathbf{T}_{F(\Sigma)}) \\ & \quad \text{iff} \quad \alpha_{\Sigma}(\phi) \in \mathbf{T}_{F(\Sigma)}. \end{aligned}$$

By symmetry, we also have, for all $\mathbf{T}' \in \text{FiFam}^{\mathcal{G}'}(\mathcal{A})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi' \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\tau_{F(\Sigma)}^{\mathcal{A}}[\rho_{F(\Sigma)}^{\mathcal{A}}[\alpha_{\Sigma}(\phi')]] \subseteq \mathbf{T}'_{F(\Sigma)} \quad \text{iff} \quad \alpha_{\Sigma}(\phi') \in \mathbf{T}'_{F(\Sigma)}.$$

Using the first of these equivalences and, once again, taking into account the surjectivity of $\langle F, \alpha \rangle$, we get, for all $\mathbf{T} \in \text{FiFam}^{\mathcal{G}}(\mathcal{A})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}(\Sigma)$,

$$\begin{aligned} \phi \in \tau_{\Sigma}^{\mathcal{A}*}(\rho^{\mathcal{A}*}(\mathbf{T})) & \quad \text{iff} \quad \tau_{\Sigma}^{\mathcal{A}}[\phi] \subseteq \rho_{\Sigma}^{\mathcal{A}*}(\mathbf{T}) \\ & \quad \text{iff} \quad \rho_{\Sigma}^{\mathcal{A}}[\tau_{\Sigma}^{\mathcal{A}}[\phi]] \subseteq \mathbf{T}_{\Sigma} \\ & \quad \text{iff} \quad \phi \in \mathbf{T}_{\Sigma}. \end{aligned}$$

Thus, $\tau^{\mathcal{A}*}(\rho^{\mathcal{A}*}(\mathbf{T})) = \mathbf{T}$, for all $\mathbf{T} \in \text{FiFam}^{\mathcal{G}}(\mathcal{A})$ and, by symmetry, we also have $\rho^{\mathcal{A}*}(\tau^{\mathcal{A}*}(\mathbf{T}')) = \mathbf{T}'$, for all $\mathbf{T}' \in \text{FiFam}^{\mathcal{G}'}(\mathcal{A})$. Therefore, $\rho^{\mathcal{A}*}$ and $\tau^{\mathcal{A}*}$ are mutually inverse bijections and reflect component-wise inclusion, since they are obviously order preserving under $\leq$. We conclude that

$$\rho^{\mathcal{A}*} : \mathbf{FiFam}^{\mathcal{G}}(\mathcal{A}) \rightleftarrows \mathbf{FiFam}^{\mathcal{G}'}(\mathcal{A}) : \tau^{\mathcal{A}*}$$

are mutually inverse order isomorphisms. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$ an N^b -algebraic system and $\theta \in \text{ConSys}(\mathbf{A})$.

Given $\phi = \vec{\phi} \triangleright_{\Sigma} \vec{\psi}$, $\phi' = \vec{\phi}' \triangleright_{\Sigma} \vec{\psi}' \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{A})$ of the same trace $\langle m, n \rangle$, we say that ϕ is **θ -equivalent to ϕ'** , denoted $\phi \theta_{\Sigma} \phi'$, if, for all $i < m$ and all $j < n$,

$$\phi_i \theta_{\Sigma} \phi'_i \quad \text{and} \quad \psi_j \theta_{\Sigma} \psi'_j.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$ an N^b -algebraic system, $\mathbf{T} \leq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{A})$ and $\theta \in \text{ConSys}(\mathbf{A})$.

We say that θ is **compatible with $\mathbf{T}$** if, for all $\Sigma \in |\mathbf{Sign}|$, and all $\phi, \phi' \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{A})$ (of the same trace),

$$\phi \theta_{\Sigma} \phi' \quad \text{and} \quad \phi \in \mathbf{T}_{\Sigma} \quad \text{imply} \quad \phi' \in \mathbf{T}_{\Sigma}.$$

An alternative characterization of compatibility is given in the following lemma.

Lemma 1930 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system, $\mathbf{T} \leq \text{Seq}^{\text{tr}}(\mathcal{A})$ and $\theta \in \text{ConSys}(\mathcal{A})$. θ is compatible with $\mathbf{T}$ if and only if the quotient morphism $\langle I, \pi^\theta \rangle : \mathcal{A} \rightarrow \mathcal{A}^\theta$ induces a strict matrix family morphism*

$$\langle I, \pi^\theta \rangle : \langle \mathcal{A}, \mathbf{T} \rangle \rightarrow \langle \mathcal{A}^\theta, \pi^\theta(\mathbf{T}) \rangle,$$

i.e., if and only if $(\pi^\theta)^{-1}(\pi^\theta(\mathbf{T})) = \mathbf{T}$.

Proof: Suppose, first, that θ is compatible with $\mathbf{T}$ and let $\Sigma \in |\mathbf{Sign}|$, $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathcal{A})$, such that $\phi \in (\pi_\Sigma^\theta)^{-1}(\pi_\Sigma^\theta(\mathbf{T}_\Sigma))$. Then, we get $\pi_\Sigma^\theta(\phi) \in \pi_\Sigma^\theta(\mathbf{T}_\Sigma)$. Hence, there exists $\phi' \in \mathbf{T}_\Sigma$, such that $\phi \theta_\Sigma \phi'$. Therefore, by the compatibility of θ with $\mathbf{T}$, we get that $\phi \in \mathbf{T}_\Sigma$. Thus, $(\pi^\theta)^{-1}(\pi^\theta(\mathbf{T})) \leq \mathbf{T}$ and, since the reverse inclusion always holds, we conclude that $(\pi^\theta)^{-1}(\pi^\theta(\mathbf{T})) = \mathbf{T}$.

Conversely, assume that $(\pi^\theta)^{-1}(\pi^\theta(\mathbf{T})) = \mathbf{T}$. Let $\Sigma \in |\mathbf{Sign}|$, $\phi, \phi' \in \text{Seq}_\Sigma^{\text{tr}}(\mathcal{A})$, such that $\phi \theta_\Sigma \phi'$ and $\phi \in \mathbf{T}_\Sigma$. Then $\phi' \in (\pi_\Sigma^\theta)^{-1}(\pi_\Sigma^\theta(\mathbf{T}_\Sigma)) = \mathbf{T}_\Sigma$ and, hence, θ is compatible with $\mathbf{T}$. $\blacksquare$

Given a Gentzen π -institution, taking the quotient of any filter family by a compatible congruence system results in a filter family on the quotient algebraic system.

Lemma 1931 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$, $\langle \mathcal{A}, \mathbf{T} \rangle$ an $\mathbf{F}$ -matrix family and $\theta \in \text{ConSys}(\mathcal{A})$. If θ is compatible with $\mathbf{T}$, then*

$$\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{A}) \quad \text{iff} \quad \mathbf{T}/\theta \in \text{FiFam}^\mathfrak{G}(\mathcal{A}^\theta).$$

Proof: Suppose that θ is compatible with $\mathbf{T}$. Then, using Lemmas 1928 and 1930, we have the following equivalences:

$$\begin{aligned} \mathbf{T}/\theta \in \text{FiFam}^\mathfrak{G}(\mathcal{A}/\theta) & \quad \text{iff} \quad (\pi^\theta \circ \alpha)^{-1}(\mathbf{T}/\theta) \in \text{ThFam}(\mathfrak{G}) \\ & \quad \text{iff} \quad \alpha^{-1}((\pi^\theta)^{-1}(\mathbf{T}/\theta)) \in \text{ThFam}(\mathfrak{G}) \\ & \quad \text{iff} \quad \alpha^{-1}(\mathbf{T}) \in \text{ThFam}(\mathfrak{G}) \\ & \quad \text{iff} \quad \mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{A}). \end{aligned}$$

Hence $\mathbf{T}/\theta$ is a $\mathfrak{G}$ -filter family of $\mathcal{A}^\theta$ iff $\mathbf{T}$ is a $\mathfrak{G}$ -filter family of $\mathcal{A}$. $\blacksquare$

The following lemma forms an analog of the characterization of the Leibniz congruence system of a filter family on a given $\mathbf{F}$ -algebraic system. It will also give rise to a corresponding operator, also termed the Leibniz operator, for theory families of Gentzen π -institutions.

Lemma 1932 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathbf{A} = \langle \mathbf{Sign}, \mathbf{SEN}, N \rangle$ an N^b -algebraic system, $\mathbf{T} \leq \text{Seq}^{\text{tr}}(\mathbf{A})$ and $\theta \in \text{ConSys}(\mathbf{A})$. θ is compatible with $\mathbf{T}$ if and only if, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$, $\langle \phi, \psi \rangle \in \theta_\Sigma$ implies, for all $\langle m, n \rangle \in \text{tr}$, all $\vec{\sigma} = \langle \sigma^0, \dots, \sigma^{m-1} \rangle$, and all $\vec{\tau} = \langle \tau^0, \dots, \tau^{n-1} \rangle$ in N^b , all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\vec{\chi} \in \mathbf{SEN}(\Sigma')$,*

$$\begin{aligned} \vec{\sigma}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\phi), \vec{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\phi), \vec{\chi}) \in \mathbf{T}_{\Sigma'} \\ \text{iff} \quad \vec{\sigma}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\psi), \vec{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\psi), \vec{\chi}) \in \mathbf{T}_{\Sigma'}. \end{aligned}$$

Proof: Suppose that $\Sigma \in |\mathbf{Sign}|$ and $\langle \phi, \psi \rangle \in \text{SEN}(\Sigma)$, such that $\langle \phi, \psi \rangle \in \theta_\Sigma$. Since θ is a congruence *system*, for all $\Sigma' \in |\mathbf{Sign}|$ and all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ $\langle \text{SEN}(f)(\phi), \text{SEN}(f)(\psi) \rangle \in \theta_{\Sigma'}$. Since θ is a *congruence system*, we get, for all $i < m$, all $j < n$ and all $\tilde{\chi} \in \text{SEN}(\Sigma')$,

$$\begin{aligned} \langle \sigma_{\Sigma'}^i(\text{SEN}(f)(\phi), \tilde{\chi}), \sigma_{\Sigma'}^i(\text{SEN}(f)(\psi), \tilde{\chi}) \rangle &\in \theta_{\Sigma'} \\ \text{and } \langle \tau_{\Sigma'}^j(\text{SEN}(f)(\phi), \tilde{\chi}), \tau_{\Sigma'}^j(\text{SEN}(f)(\psi), \tilde{\chi}) \rangle &\in \theta_{\Sigma'}. \end{aligned}$$

The conclusion follows immediately by the assumption of compatibility of θ with $\mathbf{T}$. $\blacksquare$

Lemma 1932 serves to show that, given an algebraic system $\mathbf{A}$ and $\mathbf{T} \leq \text{Seq}^{\text{tr}}(\mathbf{A})$, there exists a largest congruence system on $\mathbf{A}$ that is compatible with $\mathbf{T}$.

Corollary 1933 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$ an N^b -algebraic system and $\mathbf{T} \leq \text{Seq}^{\text{tr}}(\mathbf{A})$. There exists a largest congruence system on $\mathbf{A}$ compatible with $\mathbf{T}$.*

Proof: Define $\theta = \{\theta_\Sigma\}_{\Sigma \in |\mathbf{Sign}|}$ as follows: For all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$, $\langle \phi, \psi \rangle \in \theta_\Sigma$ iff, for all $\langle m, n \rangle \in \text{tr}$, all $\vec{\sigma} = \langle \sigma^0, \dots, \sigma^{m-1} \rangle$, and all $\vec{\tau} = \langle \tau^0, \dots, \tau^{n-1} \rangle$ in N^b , all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\tilde{\chi} \in \text{SEN}(\Sigma')$,

$$\begin{aligned} \vec{\sigma}_{\Sigma'}^{\mathbf{A}}(\text{SEN}(f)(\phi), \tilde{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathbf{A}}(\text{SEN}(f)(\psi), \tilde{\chi}) &\in \mathbf{T}_{\Sigma'} \\ \text{iff } \vec{\sigma}_{\Sigma'}^{\mathbf{A}}(\text{SEN}(f)(\phi), \tilde{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathbf{A}}(\text{SEN}(f)(\psi), \tilde{\chi}) &\in \mathbf{T}_{\Sigma'}. \end{aligned}$$

It is easy to see that θ , thus defined, is a congruence system on $\mathbf{A}$ compatible with $\mathbf{T}$. By Lemma 1932, it is the largest one compatible with $\mathbf{T}$. $\blacksquare$

The largest congruence system on $\mathbf{A}$ compatible with $\mathbf{T}$ is denoted by $\Omega^{\mathbf{A}}(\mathbf{T})$ and called the **Leibniz congruence system of $\mathbf{T}$ on $\mathbf{A}$** .

As a consequence of the definition of the Leibniz congruence system, given $\mathbf{T} \in \text{Seq}^{\text{tr}}(\mathbf{A})$ and $\theta \in \text{ConSys}(\mathbf{A})$,

$$\theta \text{ is compatible with } \mathbf{T} \text{ if and only if } \theta \leq \Omega^{\mathbf{A}}(\mathbf{T}).$$

Given an algebraic system $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$, a trace tr , a Gentzen π -institution $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ of trace tr based on $\mathbf{F}$ and an $\mathbf{F}$ -algebraic system $\mathcal{A}$, the operator

$$\Omega^{\mathbf{A}} : \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \rightarrow \text{ConSys}(\mathcal{A})$$

is called the **Leibniz operator of $\mathfrak{G}$ on $\mathcal{A}$** .

Recall from Proposition 1929 that, given two equivalent Gentzen π -institutions, the conjugate transformations establishing the equivalence induce an order isomorphism between the corresponding filter families of the gentzen π -institutions involved on arbitrary algebraic systems. It turns out that, under this isomorphism, corresponding filter families have identical Leibniz congruence systems.

Proposition 1934 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr , tr' , respectively, based on $\mathbf{F}$. If $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via a conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$ of transformations, then, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $\mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$,*

$$\Omega^{\mathcal{A}}(\mathbf{T}) = \Omega^{\mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T})).$$

Proof: Let $\Sigma \in |\mathbf{Sign}|$, $\phi, \phi' \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathcal{A})$, such that $\phi \Omega_{\Sigma}^{\mathcal{A}}(\mathbf{T}) \phi'$ and suppose that $\phi \in \rho_{\Sigma}^{\mathcal{A}*}(\mathbf{T})$. Then, we obtain $\rho_{\Sigma}^{\mathcal{A}}[\phi] \subseteq \mathbf{T}_{\Sigma}$. Thus, since, by definition, $\Omega^{\mathcal{A}}(\mathbf{T})$ is a congruence system compatible with $\mathbf{T}$, we get that $\rho_{\Sigma}^{\mathcal{A}}[\phi'] \subseteq \mathbf{T}_{\Sigma}$ and, therefore, $\phi' \in \rho_{\Sigma}^{\mathcal{A}*}(\mathbf{T})$. Hence $\Omega^{\mathcal{A}}(\mathbf{T})$ is compatible with $\rho^{\mathcal{A}*}(\mathbf{T})$, showing that $\Omega^{\mathcal{A}}(\mathbf{T}) \leq \Omega^{\mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T}))$.

Assume, conversely, that $\Sigma \in |\mathbf{Sign}|$, $\phi, \phi' \in \text{Seq}_{\Sigma}^{\text{tr}'}(\mathcal{A})$, such that

$$\phi \Omega_{\Sigma}^{\mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T})) \phi'$$

and suppose that $\phi \in \mathbf{T}_{\Sigma}$. Then, we obtain $\rho_{\Sigma}^{\mathcal{A}}[\tau_{\Sigma}^{\mathcal{A}}[\phi]] \subseteq \mathbf{T}_{\Sigma}$, i.e., $\tau_{\Sigma}^{\mathcal{A}}[\phi] \subseteq \rho_{\Sigma}^{\mathcal{A}*}(\mathbf{T})$. Thus, since, by definition, $\Omega^{\mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T}))$ is a congruence system compatible with $\rho^{\mathcal{A}*}(\mathbf{T})$, we get that $\tau_{\Sigma}^{\mathcal{A}}[\phi'] \subseteq \rho^{\mathcal{A}*}(\mathbf{T})$. Therefore, $\rho_{\Sigma}^{\mathcal{A}}[\tau_{\Sigma}^{\mathcal{A}}[\phi']] \subseteq \mathbf{T}_{\Sigma}$. So $\phi' \in \mathbf{T}_{\Sigma}$ and, hence, $\Omega^{\mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T}))$ is compatible with $\mathbf{T}$, showing that $\Omega^{\mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T})) \leq \Omega^{\mathcal{A}}(\mathbf{T})$. $\blacksquare$

As was the case with ordinary π -institutions, the Suszko operator is a very useful tool in the study of the algebraization of Gentzen π -institutions.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$ and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system. The **Suszko operator** $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}$ of $\mathfrak{G}$ on $\mathcal{A}$ is the operator

$$\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}} : \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \rightarrow \text{ConSys}(\mathcal{A})$$

defined, for all $\mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$, by

$$\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) = \bigcap \{ \Omega^{\mathcal{A}}(\mathbf{T}') : \mathbf{T} \leq \mathbf{T}' \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \}.$$

Since, obviously, for all $\mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$,

$$\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) \leq \Omega^{\mathcal{A}}(\mathbf{T}),$$

$\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ is also a congruence system on $\mathcal{A}$ compatible with $\mathbf{T}$. Moreover, the operator $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}$ is monotone on $\mathbf{FiFam}^{\mathfrak{G}}(\mathcal{A})$, for every $\mathbf{F}$ -algebraic system $\mathcal{A}$.

Using the definition of the Suszko congruence system and Corollary 1933, it is not difficult to see that the following characterization of the Suszko congruence system of a filter family holds:

Proposition 1935 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$, $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system and $\mathbf{T} \in \mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$. For all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \mathbf{SEN}(\Sigma)$, $\langle \phi, \psi \rangle \in \widetilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ if and only if, for all $\langle m, n \rangle \in \text{tr}$, all $\sigma^0, \dots, \sigma^{m-1}, \tau^0, \dots, \tau^{n-1}$ in N^b , all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\vec{\chi} \in \mathbf{SEN}(\Sigma')$,*

$$\begin{aligned} G_{\Sigma'}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}_{\Sigma'}, \vec{\sigma}_{\Sigma'}^{\mathcal{A}}(\mathbf{SEN}^b(f)(\phi), \vec{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathcal{A}}(\mathbf{SEN}^b(f)(\psi), \vec{\chi})) \\ = G_{\Sigma'}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}_{\Sigma'}, \vec{\sigma}_{\Sigma'}^{\mathcal{A}}(\mathbf{SEN}^b(f)(\psi), \vec{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathcal{A}}(\mathbf{SEN}^b(f)(\phi), \vec{\chi})). \end{aligned}$$

Proof: The statement follows directly by combining the definition of the Suszko congruence system of $\mathbf{T}$ on $\mathcal{A}$ with the characterization of the Leibniz operator of each $\mathbf{T}'$, with $\mathbf{T} \leq \mathbf{T}'$, given in the proof of Corollary 1933. ■

Moreover, as is clear from the definition, we have

Lemma 1936 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr be a trace, $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$, and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ an $\mathbf{F}$ -algebraic system. The Suszko and the Leibniz operators on $\mathcal{A}$ coincide, i.e., $\widetilde{\Omega}^{\mathfrak{G}, \mathcal{A}} = \Omega^{\mathcal{A}}$, if and only if $\Omega^{\mathcal{A}}$ is monotone on $\mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$.*

Proof: Since $\widetilde{\Omega}^{\mathfrak{G}, \mathcal{A}}$ is monotone on $\mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$, if the two operators coincide, $\Omega^{\mathcal{A}}$ is also monotone on $\mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$.

On the other hand, if $\Omega^{\mathcal{A}}$ is monotone on $\mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$, then, for all $\mathbf{T} \in \mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$, we get

$$\begin{aligned} \widetilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) &= \bigcap \{ \Omega^{\mathcal{A}}(\mathbf{T}') : \mathbf{T} \leq \mathbf{T}' \in \mathbf{FiFam}^\mathfrak{G}(\mathcal{A}) \} \\ &= \Omega^{\mathcal{A}}(\mathbf{T}). \end{aligned}$$

Therefore, $\widetilde{\Omega}^{\mathfrak{G}, \mathcal{A}} = \Omega^{\mathcal{A}}$. ■

An analog of Proposition 1934 holds also for the Suszko operator. That is, under the isomorphism between the corresponding filter families of two gentzen π -institutions that are equivalent, corresponding filter families have identical Suszko congruence systems.

Proposition 1937 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle, \mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr, tr' , respectively, based on $\mathbf{F}$. If $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$, then, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $\mathbf{T} \in \mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$,*

$$\widetilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) = \widetilde{\Omega}^{\mathfrak{G}', \mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T})).$$

Proof: Since $\rho^{\mathcal{A}*} : \mathbf{FiFam}^\mathfrak{G}(\mathcal{A}) \rightarrow \mathbf{FiFam}^{\mathfrak{G}'}(\mathcal{A})$ is an order isomorphism, and taking into account Proposition 1934, we obtain, for all $\mathbf{T} \in \mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$,

$$\begin{aligned} \widetilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) &= \bigcap \{ \Omega^{\mathcal{A}}(\mathbf{T}') : \mathbf{T} \leq \mathbf{T}' \in \mathbf{FiFam}^\mathfrak{G}(\mathcal{A}) \} \\ &= \bigcap \{ \Omega^{\mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T}')) : \rho^{\mathcal{A}*}(\mathbf{T}) \leq \rho^{\mathcal{A}*}(\mathbf{T}') \in \mathbf{FiFam}^{\mathfrak{G}'}(\mathcal{A}) \} \\ &= \bigcap \{ \Omega^{\mathcal{A}}(\mathbf{T}'') : \rho^{\mathcal{A}*}(\mathbf{T}) \leq \mathbf{T}'' \in \mathbf{FiFam}^{\mathfrak{G}'}(\mathcal{A}) \} \\ &= \widetilde{\Omega}^{\mathfrak{G}', \mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T})). \end{aligned}$$

Thus, the conclusion holds. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. A $\mathfrak{G}$ -matrix family $\mathfrak{A} = \langle \mathcal{A}, \mathbf{T} \rangle$ is called **Suszko reduced** if

$$\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) = \Delta^{\mathcal{A}}.$$

We denote by $\text{MatFam}^{\text{Su}}(\mathfrak{G})$ the class of all Suszko reduced $\mathfrak{G}$ -matrix families.

For every $\mathfrak{G}$ -matrix family $\mathfrak{A} = \langle \mathcal{A}, \mathbf{T} \rangle$, the quotient structure

$$\langle \mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}), \mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) \rangle$$

is also a $\mathfrak{G}$ -matrix family and it is Suszko reduced. Moreover, if a $\mathfrak{G}$ -matrix family $\langle \mathcal{A}, \mathbf{T} \rangle$ is Suszko reduced, it is obviously isomorphic to a $\mathfrak{G}$ -matrix family of this form.

Among other things, Suszko reduced $\mathfrak{G}$ -matrix families are important because they form a class of structures with respect to which $\mathfrak{G}$ enjoys a completeness property.

Theorem 1938 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr be a trace, and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, $\phi \in G_{\Sigma}(\Phi)$ if and only if, for all $\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$, all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,*

$$\alpha_{\Sigma'}(\text{SEN}^b(f)(\Phi)) \subseteq \mathbf{T}_{F(\Sigma')} \quad \text{implies} \quad \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \in \mathbf{T}_{F(\Sigma')}.$$

Proof: Suppose $\phi \in G_{\Sigma}(\Phi)$ and let $\langle \mathcal{A}, \mathbf{T} \rangle$ be a Suszko reduced $\mathfrak{G}$ -matrix family. Then $\langle \mathcal{A}, \mathbf{T} \rangle$ is, in particular, a $\mathfrak{G}$ -matrix family, whence the conclusion holds by applying the definition of a $\mathfrak{G}$ -filter family to the $\mathfrak{G}$ -filter family $\mathbf{T}$. Suppose, conversely, that, for all $\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$, all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\alpha_{\Sigma'}(\text{SEN}^b(f)(\Phi)) \subseteq \mathbf{T}_{F(\Sigma')} \quad \text{implies} \quad \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi)) \in \mathbf{T}_{F(\Sigma')}.$$

Let $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$ and consider the Suszko reduced $\mathfrak{G}$ -matrix family

$$\langle \mathcal{F}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}), \mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \rangle.$$

Then, we have, by hypothesis, taking $\Sigma' = \Sigma$ and $f = i_{\Sigma}$,

$$\Phi/\tilde{\Omega}_{\Sigma}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \subseteq \mathbf{T}_{\Sigma}/\tilde{\Omega}_{\Sigma}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \quad \text{implies} \quad \phi/\tilde{\Omega}_{\Sigma}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \in \mathbf{T}_{\Sigma}/\tilde{\Omega}_{\Sigma}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}),$$

i.e., using the compatibility of $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$ with $\mathbf{T}$, $\Phi \subseteq \mathbf{T}_{\Sigma}$ implies $\phi \in \mathbf{T}_{\Sigma}$. Equivalently, since $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$ was arbitrary, $\phi \in G_{\Sigma}(\Phi)$. $\blacksquare$

If two Gentzen π -institutions are equivalent, then the classes of algebraic system reducts of their Suszko reduced matrix families coincide.

Theorem 1939 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr , tr' , respectively, based on $\mathbf{F}$. If $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$, then $\text{MatFam}^{\text{Su}}(\mathfrak{G})$ and $\text{MatFam}^{\text{Su}}(\mathfrak{G}')$ have the same class of $\mathbf{F}$ -algebraic system reducts.*

Proof: Suppose that $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ is the $\mathbf{F}$ -algebraic system reduct of $\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$. Then, by definition, we have $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) = \Delta^{\mathcal{A}}$. Therefore, by Proposition 1937, we obtain $\tilde{\Omega}^{\mathfrak{G}', \mathcal{A}}(\rho^{\mathcal{A}*}(\mathbf{T})) = \Delta^{\mathcal{A}}$. Since, $\rho^{\mathcal{A}*}(\mathbf{T}) \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$, we conclude that $\langle \mathcal{A}, \rho^{\mathcal{A}*}(\mathbf{T}) \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G}')$ and, hence, $\mathcal{A}$ is also the $\mathbf{F}$ -algebraic system reduct of a Suszko reduced $\mathfrak{G}'$ -matrix family. By symmetry of equivalence, every $\mathbf{F}$ -algebraic system reduct of a Suszko reduced $\mathfrak{G}'$ -matrix family is also one of a Suszko reduced $\mathfrak{G}$ -matrix family. Therefore, the two classes of $\mathbf{F}$ -algebraic system reducts coincide. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr be a trace, and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. The class of all $\mathbf{F}$ -algebraic system reducts of Suszko reduced $\mathfrak{G}$ -matrix families is denoted by $\text{AlgSys}(\mathfrak{G})$, i.e., we have, by definition,

$$\begin{aligned} \text{AlgSys}(\mathfrak{G}) &= \{ \mathcal{A} : (\exists \mathbf{T} \leq \text{Seq}^{\text{tr}}(\mathcal{A})) (\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})) \} \\ &= \{ \mathcal{A} : (\exists \mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})) (\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) = \Delta^{\mathcal{A}}) \}. \end{aligned}$$

It is not difficult to show that the class $\text{AlgSys}(\mathfrak{G})$ is closed under $\text{III}^{\triangleleft}$ and, thence, conclude that the class of all $\text{AlgSys}(\mathfrak{G})$ -congruence systems on every $\mathbf{F}$ -algebraic system $\mathcal{A}$ forms a complete lattice under signature-wise inclusion.

Proposition 1940 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. Then $\text{AlgSys}(\mathfrak{G})$ is closed under subdirect intersections, i.e.,*

$$\text{III}^{\triangleleft}(\text{AlgSys}(\mathfrak{G})) \subseteq \text{AlgSys}(\mathfrak{G}).$$

Proof: Suppose that $\mathcal{A}^i = \langle \mathbf{A}^i, \langle F^i, \alpha^i \rangle \rangle \in \text{AlgSys}(\mathfrak{G})$, for all $i \in I$, and let

$$\langle H^i, \gamma^i \rangle : \mathfrak{A} \rightarrow \mathcal{A}^i, \quad i \in I,$$

be a subdirect intersection, i.e., such that $\bigcap_{i \in I} \text{Ker}(\langle H^i, \gamma^i \rangle) = \Delta^{\mathcal{A}}$. Then, for all $i \in I$, there exists $\mathbf{T}^i \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}^i)$, such that $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}^i}(\mathbf{T}^i) = \Delta^{\mathcal{A}^i}$. We consider the least $\mathfrak{G}$ -filter family on $\mathcal{A}$, namely $\bigcap \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$. We have

$$\begin{aligned} \tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\bigcap \text{FiFam}^{\mathfrak{G}}(\mathcal{A})) &= \bigcap \{ \Omega^{\mathcal{A}}(\mathbf{X}) : \mathbf{X} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \} \\ &\leq \bigcap_{i \in I} \bigcap_{\mathbf{X}^i \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}^i)} (\gamma^i)^{-1} (\Omega^{\mathcal{A}^i}(\mathbf{X}^i)) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1} (\bigcap_{\mathbf{X}^i \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}^i)} \Omega^{\mathcal{A}^i}(\mathbf{X}^i)) \\ &\leq \bigcap_{i \in I} (\gamma^i)^{-1} (\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}^i}(\mathbf{T}^i)) \\ &= \bigcap_{i \in I} (\gamma^i)^{-1} (\Delta^{\mathcal{A}^i}) \\ &= \Delta^{\mathcal{A}}. \end{aligned}$$

Hence, we get that $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$. Therefore, $\text{AlgSys}(\mathfrak{G})$ is indeed closed under subdirect intersections. $\blacksquare$

26.6 Equivalence and Algebraic Counterpart

In Theorem 1927, given a π -institution $\mathfrak{G}$ and a trace tr' , we gave a characterization of the existence of an equivalence $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$ of $\mathfrak{G}$ with some Gentzen π -institution $\mathfrak{G}'$, having the given trace tr' . We strengthen this result here, by considering only $\mathfrak{G}$ -filter families on algebraic systems belonging to $\text{AlgSys}(\mathfrak{G})$.

Theorem 1941 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' be traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is equivalent to a Gentzen π -institution $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ of trace tr' based on $\mathbf{F}$ if and only if there exist a tr - tr' -transformation τ and a tr' - tr -transformation ρ , such that, for all $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$:*

- (1) $\rho^{A*} : \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \rightarrow \text{SenFam}(\text{Seq}^{\text{tr}'}(\mathcal{A}))$ is injective on $\text{FiFam}^{\mathfrak{G}}(\mathcal{A})$;
- (2) For all $\Sigma \in |\text{Sign}|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathcal{A})$, $\rho_{\Sigma}^{A*}(G^{\mathfrak{G}, \mathcal{A}}(\phi)) = G'_{\Sigma}(\tau_{\Sigma}^{\mathcal{A}}[\phi])$, where G' is the closure system on $\mathcal{A}$ induced by $\rho^{A*}(\text{FiFam}^{\mathfrak{G}}(\mathcal{A}))$.

Proof: Suppose, first, that there exists an equivalence $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$, where $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ is a Gentzen π -institution of trace tr' based on $\mathbf{F}$. By Proposition 1929, we know that $\rho^{A*} : \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \rightarrow \text{FiFam}^{\mathfrak{G}'}(\mathcal{A})$ is an order isomorphism, whence, in particular, it is injective on $\text{FiFam}^{\mathfrak{G}}(\mathcal{A})$. Moreover, for all $\Sigma \in |\text{Sign}|$ and all $\psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathcal{A})$, we have

$$\begin{aligned} \psi \in \rho_{\Sigma}^{A*}(G^{\mathfrak{G}, \mathcal{A}}(\phi)) & \text{ iff } \rho_{\Sigma}^{\mathcal{A}}[\psi] \subseteq G_{\Sigma}^{\mathfrak{G}, \mathcal{A}}(\phi) \\ & \text{ iff } \tau_{\Sigma}^{\mathcal{A}}[\rho_{\Sigma}^{\mathcal{A}}[\psi]] \subseteq G_{\Sigma}^{\mathfrak{G}', \mathcal{A}}(\tau_{\Sigma}^{\mathcal{A}}[\phi]) \\ & \text{ iff } \psi \in G_{\Sigma}^{\mathfrak{G}', \mathcal{A}}(\tau_{\Sigma}^{\mathcal{A}}[\phi]). \end{aligned}$$

Therefore, $\rho_{\Sigma}^{A*}(G^{\mathfrak{G}, \mathcal{A}}(\phi)) = G_{\Sigma}^{\mathfrak{G}', \mathcal{A}}(\tau_{\Sigma}^{\mathcal{A}}[\phi])$ and, again by Proposition 1929, $G^{\mathfrak{G}', \mathcal{A}}$ is the closure system on $\mathcal{A}$ induced by $\rho^{A*}(\text{FiFam}^{\mathfrak{G}}(\mathcal{A}))$.

Suppose, conversely, that there exist a tr - tr' -transformation τ and a tr' - tr -transformation ρ , such that Conditions (1) and (2) of the statement hold. The function ρ^{A*} commutes with intersections of $\mathfrak{G}$ -filter families on $\mathcal{A}$. As a consequence, we obtain, on the one hand, that ρ^{A*} is order reflecting on $\text{FiFam}^{\mathfrak{G}}(\mathcal{A})$ and, on the other, that $\rho^{A*}(\text{FiFam}^{\mathfrak{G}}(\mathcal{A}))$ is closed under intersection, and, hence, defines a closure system on $\text{Seq}^{\text{tr}'}(\mathcal{A})$, which we denote by G' . It suffices now, to prove the two conditions of Theorem 1927.

Assume, first, that $\mathbf{T}, \mathbf{T}' \in \text{ThFam}(\mathfrak{G})$, such that $\rho^*(\mathbf{T}) \leq \rho^*(\mathbf{T}')$. Let $\mathbf{X} = G(\rho[\rho^*(\mathbf{T})])$ and $\mathcal{A} = \mathcal{F}/\widetilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})$. Since $\mathbf{X}/\widetilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X}) \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$, we get that $\langle \mathcal{A}, \mathbf{X}/\widetilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X}) \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$. Therefore, $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$.

Further, $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$ and $\rho[\rho^*(\mathbf{T})] \leq \mathbf{T}$, which give $\mathbf{X} \leq \mathbf{T}$. Moreover, $\rho[\rho^*(\mathbf{T})] \leq \rho[\rho^*(\mathbf{T}')] \leq \mathbf{T}'$. Hence, $\mathbf{X} \leq \mathbf{T}'$. Thus, by the monotonicity of the Suszko operator, $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X}) \leq \tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$ and $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X}) \leq \tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}')$. These imply that $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})$ is compatible with both $\mathbf{T}$ and $\mathbf{T}'$. This, in turn, gives that both $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})$ and $\mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})$ are $\mathfrak{G}$ -filter families on $\mathcal{A}$ and, furthermore, that

$$\rho^{A*}(\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})) = \rho^*(\mathbf{T})/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})$$

and, similarly, $\rho^{A*}(\mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})) = \rho^*(\mathbf{T}')/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})$. Since, by hypothesis, $\rho^*(\mathbf{T}) \leq \rho^*(\mathbf{T}')$, we get

$$\rho^{A*}(\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})) \leq \rho^{A*}(\mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})).$$

Thus, by Condition (1) in the hypothesis, we get $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X}) \leq \mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})$, whence, using again the compatibility of $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{X})$ with both $\mathbf{T}$ and $\mathbf{T}'$, we obtain $\mathbf{T} \leq \mathbf{T}'$. We conclude that ρ^* is order reflecting and, therefore, a fortiori, injective on $\text{ThFam}(\mathfrak{G})$.

Finally, let $\Sigma \in |\mathbf{Sign}^b|$, $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ and consider $\theta = \tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\text{Thm}(\mathfrak{G}))$. Then $\mathcal{F}/\theta \in \text{AlgSys}(\mathfrak{G})$, whence, by hypothesis,

$$\rho^{(\mathcal{F}/\theta)*}(G^{\mathfrak{G}, \mathcal{F}/\theta}(\phi/\theta_{\Sigma})) = G'_{\Sigma}(\tau_{\Sigma}^{\mathcal{F}/\theta}[\phi/\theta_{\Sigma}]),$$

where G' is the closure system on $\mathcal{F}/\theta$ generated by

$$\begin{aligned} \rho^{(\mathcal{F}/\theta)*}(\text{FiFam}^{\mathfrak{G}}(\mathcal{F}/\theta)) &= \rho^{(\mathcal{F}/\theta)*}(\text{ThFam}(\mathfrak{G})/\theta) \\ &= \rho^*(\text{ThFam}(\mathfrak{G}))/\theta. \end{aligned}$$

Thus, we get $\rho_{\Sigma}^*(G(\phi))/\theta = G'_{\Sigma}(\tau_{\Sigma}[\phi]/\theta_{\Sigma})$, whence

$$\begin{aligned} \rho_{\Sigma}^{(\mathcal{F}/\theta)*}(G(\phi)/\theta) &= \cap \{\rho^*(\mathbf{X})/\theta : \tau_{\Sigma}[\phi]/\theta \subseteq \rho^*(\mathbf{X})/\theta\} \\ &= \cap \{\rho^*(\mathbf{X}) : \tau_{\Sigma}[\phi] \subseteq \rho^*(\mathbf{X})\}/\theta. \end{aligned}$$

Therefore, $\rho_{\Sigma}^*(G(\phi)) = \cap \{\rho^*(\mathbf{X}) : \tau_{\Sigma}[\phi] \subseteq \rho^*(\mathbf{X})\} = G''(\tau_{\Sigma}[\phi])$, where G'' is the closure system on $\mathcal{F}$ generated by $\rho^*(\text{ThFam}(\mathfrak{G}))$. ■

Theorem 1941 may be used to provide a characterization of equivalence based on the coincidence of the algebraic counterparts of two Gentzen π -institutions.

Theorem 1942 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr , tr' , respectively, based on $\mathbf{F}$. $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent if and only if*

- $\text{AlgSys}(\mathfrak{G}) = \text{AlgSys}(\mathfrak{G}')$ and
- *there exist a tr - tr' -transformation τ and a tr' - tr -transformation ρ , such that, for all $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$,*

- $\rho^{A*} : \mathbf{FiFam}^{\mathfrak{G}}(\mathcal{A}) \rightarrow \mathbf{FiFam}^{\mathfrak{G}'}(\mathcal{A})$ is an order isomorphism and
- for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{Seq}^{\text{tr}}(\mathcal{A})$,

$$\rho_{\Sigma}^{A*}(G^{\mathfrak{G},\mathcal{A}}(\phi)) = G'_{\Sigma}{}^{\mathcal{A}}(\tau_{\Sigma}^{\mathcal{A}}[\phi]),$$

where $G'^{\mathcal{A}}$ is the closure system on $\mathcal{A}$ induced by $\rho^{A*}(\mathbf{FiFam}^{\mathfrak{G}}(\mathcal{A}))$.

Proof: Suppose that $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$. Then, by Theorem 1939, $\text{AlgSys}(\mathfrak{G}) = \text{AlgSys}(\mathfrak{G}')$. By Proposition 1929, ρ^{A*} is an order isomorphism and, finally, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathcal{A})$ and all $\phi' \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathcal{A})$,

$$\begin{aligned} \phi' \in \rho_{\Sigma}^{A*}(G^{\mathfrak{G},\mathcal{A}}(\phi)) & \text{ iff } \rho_{\Sigma}^{\mathcal{A}}[\phi'] \subseteq G_{\Sigma}^{\mathfrak{G},\mathcal{A}}(\phi) \\ & \text{ iff } \tau_{\Sigma}^{\mathcal{A}}[\rho_{\Sigma}^{\mathcal{A}}[\phi']] \subseteq G'_{\Sigma}{}^{\mathcal{A}}(\tau_{\Sigma}^{\mathcal{A}}[\phi]) \\ & \text{ iff } \phi' \in G'_{\Sigma}{}^{\mathcal{A}}(\tau_{\Sigma}^{\mathcal{A}}[\phi]), \end{aligned}$$

i.e., for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{Seq}^{\text{tr}}(\mathcal{A})$, $\rho_{\Sigma}^{A*}(G^{\mathfrak{G},\mathcal{A}}(\phi)) = G'_{\Sigma}{}^{\mathcal{A}}(\tau_{\Sigma}^{\mathcal{A}}[\phi])$.

Conversely, assume that the conditions in the claimed characterization of equivalence hold. Then, by Theorem 1941, there exists a Gentzen π -institution $\mathfrak{X}'$ of trace tr' to which $\mathfrak{G}$ is equivalent, such that $\rho^* : \mathbf{ThFam}(\mathfrak{G}) \rightarrow \mathbf{ThFam}(\mathfrak{X}')$ is an order isomorphism. Thus, ρ^* is both order preserving and order reflecting and, hence, injective, on $\mathbf{ThFam}(\mathfrak{G})$. Thus, it suffices to show that it is onto $\mathbf{ThFam}(\mathfrak{G}')$.

Suppose $\mathbf{T} \in \mathbf{ThFam}(\mathfrak{G}')$. Set $\mathcal{A} = \mathcal{F}/\Omega(\mathbf{T})$ and let $\langle I, \pi \rangle : \mathcal{F} \rightarrow \mathcal{A}$ be the quotient morphism. Then, since $\tilde{\Omega}^{\mathfrak{G},\mathcal{F}}(\mathbf{T}) \leq \Omega(\mathbf{T})$, we get, by the definition of $\text{AlgSys}(\mathfrak{G})$ and the hypothesis, $\mathcal{A} \in \text{AlgSys}(\mathfrak{G}) = \text{AlgSys}(\mathfrak{G}')$. By the compatibility of $\Omega(\mathbf{T})$ with $\mathbf{T}$, we get that $\mathbf{T}/\Omega(\mathbf{T}) \in \mathbf{FiFam}^{\mathfrak{G}}(\mathcal{A})$ and $\pi^{-1}(\mathbf{T}/\Omega(\mathbf{T})) = \mathbf{T}$. By hypothesis, $\rho^{A*}(\mathbf{T}/\Omega(\mathbf{T})) \in \mathbf{FiFam}^{\mathfrak{G}'}(\mathcal{A})$, whence $\pi^{-1}(\rho^{A*}(\mathbf{T}/\Omega(\mathbf{T}))) \in \mathbf{ThFam}(\mathfrak{G})$. On the other hand, we have

$$\rho^*(\mathbf{T}) = \rho^*(\pi^{-1}(\mathbf{T}/\Omega(\mathbf{T}))) = \pi^{-1}(\rho^{A*}(\mathbf{T}/\Omega(\mathbf{T}))).$$

Hence, we obtain $\rho^*(\mathbf{T}) \in \mathbf{ThFam}(\mathfrak{G})$.

Finally, consider $\mathbf{T}' \in \mathbf{ThFam}(\mathfrak{G}')$. Set $\mathcal{B} = \mathcal{F}/\Omega(\mathbf{T}') \in \text{AlgSys}(\mathfrak{G}') = \text{AlgSys}(\mathfrak{G})$ and let $\langle I, \pi' \rangle : \mathcal{F} \rightarrow \mathcal{B}$ be the quotient morphism. Then we have $\mathbf{T}'/\Omega(\mathbf{T}') \in \mathbf{FiFam}^{\mathfrak{G}'}(\mathcal{B})$ and, by compatibility, $\pi'^{-1}(\mathbf{T}'/\Omega(\mathbf{T}')) = \mathbf{T}'$. By hypothesis, there exists $\mathbf{T} \in \mathbf{FiFam}^{\mathfrak{G}}(\mathcal{B})$, such that $\mathbf{T}'/\Omega(\mathbf{T}') = \rho^{\mathcal{B}*}(\mathbf{T})$. On the other hand, $\pi'^{-1}(\mathbf{T}) \in \mathbf{ThFam}(\mathfrak{G})$ and

$$\rho^*(\pi'^{-1}(\mathbf{T})) = \pi'^{-1}(\rho^{\mathcal{B}*}(\mathbf{T})) = \pi'^{-1}(\mathbf{T}'/\Omega(\mathbf{T}')) = \mathbf{T}'.$$

thus, ρ^* maps $\mathbf{ThFam}(\mathfrak{G})$ onto $\mathbf{ThFam}(\mathfrak{G}')$ and, hence, it is an order isomorphism from $\mathbf{ThFam}(\mathfrak{G})$ onto $\mathbf{ThFam}(\mathfrak{G}')$. Therefore, $\mathfrak{G} = \mathfrak{X}$ and $\mathfrak{G}$ is equivalent to $\mathfrak{G}$. $\blacksquare$

Directly from Theorem 1941, we get the following

Corollary 1943 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is Hilbertizable if and only if there exist a $\text{tr}\text{-}\{\langle 0, 1 \rangle\}$ -transformation τ and a $\{\langle 0, 1 \rangle\}$ - tr -transformation ρ , such that, for all $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$:*

- (1) $\rho^{A*} : \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \rightarrow \text{SenFam}(\mathcal{A})$ is injective on $\text{FiFam}^{\mathfrak{G}}(\mathcal{A})$;
- (2) For all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathcal{A})$,

$$\rho_{\Sigma}^{A*}(G^{\mathfrak{G}, \mathcal{A}}(\phi)) = G'_{\Sigma}(\tau_{\Sigma}^{\mathcal{A}}[\phi]),$$

where $G'^{\mathcal{A}}$ is the closure system on $\mathcal{A}$ induced by $\rho^{A*}(\text{FiFam}^{\mathfrak{G}}(\mathcal{A}))$.

Proof: This is a special case of Theorem 1941. ■

Specializing further, we get the following result characterizing simple Hilbertizability.

Corollary 1944 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is simply Hilbertizable if and only if there exists a $\text{tr}\text{-}\{\langle 0, 1 \rangle\}$ -transformation τ , such that:*

- (1) For all $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$ and all $\mathbf{T}, \mathbf{T}' \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$,

$$\mathbf{T} \cap \triangleright \mathcal{A} = \mathbf{T}' \cap \triangleright \mathcal{A} \quad \text{implies} \quad \mathbf{T} = \mathbf{T}';$$

- (2) For all $\Sigma \in |\mathbf{Sign}|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathcal{A})$,

$$G_{\Sigma}^{\mathfrak{G}, \mathcal{A}}(\phi) \cap \triangleright \mathcal{A} = \bigcap \{ \triangleright \mathbf{T}_{\Sigma} : \tau_{\Sigma}^{\mathcal{A}}[\phi] \subseteq \mathbf{T}_{\Sigma}, \mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \}.$$

Proof: It suffices to see that Conditions (1) and (2) in the statement reflect exactly Conditions (1) and (2) in the statement of Corollary 1943, where the role of ρ is assumed by the special $\{\langle 0, 1 \rangle\}$ - tr -transformation ρ^0 . ■

Finally, we obtain a characterization of those algebraic Gentzen π -institutions, i.e., Gentzen π -institutions associated with quasivarieties of algebraic systems, which are equivalent to some Hilbert π -institution.

Corollary 1945 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a quasivariety of $\mathbf{F}$ -algebraic systems. $\mathfrak{G}^{\mathbf{K}} = \langle \mathbf{F}, G^{\mathbf{K}} \rangle$ is Hilbertizable if and only if there exists a $\{\langle 1, 1 \rangle\}$ - $\{\langle 0, 1 \rangle\}$ -transformation τ and a $\{\langle 0, 1 \rangle\}$ - $\{\langle 1, 1 \rangle\}$ -transformation ρ , such that, for all $\mathcal{A} \in \mathbf{K}$:*

- (1) $\rho^{A*} : \text{ConSys}^{\mathbf{K}}(\mathcal{A}) \rightarrow \text{SenFam}(\mathcal{A})$ is injective on $\text{ConSys}^{\mathbf{K}}(\mathcal{A})$;

(2) For all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$,

$$\rho_{\Sigma}^{A*}(\Theta^{K,A}(\phi \approx \psi)) = G'^A(\tau_{\Sigma}^A[\phi; \psi]),$$

where G'^A is the closure system on $\mathcal{A}$ induced by $\rho^{A*}(\text{ConSys}^K(\mathcal{A}))$.

Proof: This is again a specialization of Theorem 1941 for $\mathfrak{G} = \mathfrak{G}^K$, where we take into account the facts $\text{FiFam}^{\mathfrak{G}^K}(\mathcal{A}) = \text{ConSys}^K(\mathcal{A})$, $\text{AlgSys}(\mathfrak{G}^K) = K$ and, for all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi \in \text{SEN}(\Sigma)$, we have, under appropriate identifications, $G^{\mathfrak{G}^K, \mathcal{A}}(\phi \triangleright_{\Sigma} \psi) = \Theta^{K, \mathcal{A}}(\phi \approx \psi)$. ■

26.7 Protoalgebraicity

We now start a relatively brief tour of analogs of some of the classes in the algebraic hierarchy of π -institutions that were introduced in the earlier chapters of this work, as adapted and generalized for Gentzen π -institutions. Even though we revisit and recast only very few of the classes considered previously for π -institutions, the observant reader would realize that all other classes have similarly adapted analogs that have analogous properties.

In this section, we define protoalgebraic and syntactically protoalgebraic Gentzen π -institutions and study some of their properties. In the following section, we shall take a look at order algebraizable Gentzen π -institutions, which parallel the order algebraizable π -institutions of Chapter 25. In the last section, we look at completely reflective and truth equational Gentzen π -institutions.

We look, first, at some properties of the Leibniz operator, whose analogs for π -institutions have been established in Chapter 2.

Lemma 1946 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, $\mathbf{A} = \langle \mathbf{Sign}, \text{SEN}, N \rangle$, $\mathbf{B} = \langle \mathbf{Sign}', \text{SEN}', N' \rangle$ be N^b -algebraic systems and $\langle H, \gamma \rangle : \mathbf{A} \rightarrow \mathbf{B}$ a morphism. For every trace tr and all $\mathbf{T} \leq \text{Seq}^{\text{tr}}(\mathbf{B})$,*

- (a) $\gamma^{-1}(\Omega^{\mathbf{B}}(\mathbf{T})) \leq \Omega^{\mathbf{A}}(\gamma^{-1}(\mathbf{T}));$
- (b) $\gamma^{-1}(\Omega^{\mathbf{B}}(\mathbf{T})) = \Omega^{\mathbf{A}}(\gamma^{-1}(\mathbf{T})),$ if $\langle H, \gamma \rangle$ is surjective.

Proof:

- (a) It is straightforward to check that $\gamma^{-1}(\Omega^{\mathbf{B}}(\mathbf{T}))$ is a congruence system on $\mathbf{A}$ compatible with $\gamma^{-1}(\mathbf{T})$. Hence, by the maximality property of $\Omega^{\mathbf{A}}(\gamma^{-1}(\mathbf{T}))$, we get that $\gamma^{-1}(\Omega^{\mathbf{B}}(\mathbf{T})) \leq \Omega^{\mathbf{A}}(\gamma^{-1}(\mathbf{T}))$.
- (b) Suppose, now, that $\langle H, \gamma \rangle$ is surjective and let $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\langle \phi, \psi \rangle \in \Omega_{\Sigma}^{\mathbf{A}}(\gamma^{-1}(\mathbf{T}))$. Then, by Lemma 1932, we get

that, for all $\langle m, n \rangle \in \text{tr}$, all $\vec{\sigma} = \langle \sigma^0, \dots, \sigma^{m-1} \rangle$, and all $\vec{\tau} = \langle \tau^0, \dots, \tau^{n-1} \rangle$ in N^b , all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\vec{\chi} \in \mathbf{SEN}(\Sigma')$,

$$\begin{aligned} \vec{\sigma}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\phi), \vec{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\phi), \vec{\chi}) &\in \gamma_{\Sigma'}^{-1}(\mathbf{T}_{H(\Sigma')}) \\ \text{iff } \vec{\sigma}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\psi), \vec{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\psi), \vec{\chi}) &\in \gamma_{\Sigma'}^{-1}(\mathbf{T}_{H(\Sigma')}). \end{aligned}$$

Equivalently,

$$\begin{aligned} \gamma_{\Sigma'}(\vec{\sigma}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\phi), \vec{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\phi), \vec{\chi})) &\in \mathbf{T}_{H(\Sigma')} \\ \text{iff } \gamma_{\Sigma'}(\vec{\sigma}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\psi), \vec{\chi}) \triangleright_{\Sigma'} \vec{\tau}_{\Sigma'}^{\mathbf{A}}(\mathbf{SEN}(f)(\psi), \vec{\chi})) &\in \mathbf{T}_{H(\Sigma')}. \end{aligned}$$

This holds if and only if, by the morphism property,

$$\begin{aligned} \vec{\sigma}_{H(\Sigma')}^{\mathbf{B}}(\gamma_{\Sigma'}(\mathbf{SEN}(f)(\phi)), \gamma_{\Sigma'}(\vec{\chi})) \\ \triangleright_{H(\Sigma')} \vec{\tau}_{H(\Sigma')}^{\mathbf{B}}(\gamma_{\Sigma'}(\mathbf{SEN}(f)(\phi)), \gamma_{\Sigma'}(\vec{\chi})) &\in \mathbf{T}_{H(\Sigma')} \\ \text{iff } \vec{\sigma}_{H(\Sigma')}^{\mathbf{B}}(\gamma_{\Sigma'}(\mathbf{SEN}(f)(\psi)), \gamma_{\Sigma'}(\vec{\chi})) \\ \triangleright_{H(\Sigma')} \vec{\tau}_{H(\Sigma')}^{\mathbf{B}}(\gamma_{\Sigma'}(\mathbf{SEN}(f)(\psi)), \gamma_{\Sigma'}(\vec{\chi})) &\in \mathbf{T}_{H(\Sigma')}. \end{aligned}$$

Equivalently, by the naturality of γ ,

$$\begin{aligned} \vec{\sigma}_{H(\Sigma')}^{\mathbf{B}}(\mathbf{SEN}'(H(f))(\gamma_{\Sigma}(\phi)), \gamma_{\Sigma'}(\vec{\chi})) \\ \triangleright_{H(\Sigma')} \vec{\tau}_{H(\Sigma')}^{\mathbf{B}}(\mathbf{SEN}'(H(f))(\gamma_{\Sigma}(\phi)), \gamma_{\Sigma'}(\vec{\chi})) &\in \mathbf{T}_{H(\Sigma')} \\ \text{iff } \vec{\sigma}_{H(\Sigma')}^{\mathbf{B}}(\mathbf{SEN}'(H(f))(\gamma_{\Sigma}(\psi)), \gamma_{\Sigma'}(\vec{\chi})) \\ \triangleright_{H(\Sigma')} \vec{\tau}_{H(\Sigma')}^{\mathbf{B}}(\mathbf{SEN}'(H(f))(\gamma_{\Sigma}(\psi)), \gamma_{\Sigma'}(\vec{\chi})) &\in \mathbf{T}_{H(\Sigma')}. \end{aligned}$$

Hence, taking into account the surjectivity of $\langle H, \gamma \rangle$, by Lemma 1932, we get $\langle \gamma_{\Sigma}(\phi), \gamma_{\Sigma}(\psi) \rangle \in \Omega_{H(\Sigma)}^{\mathbf{B}}(\mathbf{T})$, i.e., $\gamma_{\Sigma}(\Omega_{\Sigma}^{\mathbf{A}}(\gamma^{-1}(\mathbf{T}))) \subseteq \Omega_{H(\Sigma)}^{\mathbf{B}}(\mathbf{T})$. We conclude that $\Omega^{\mathbf{A}}(\gamma^{-1}(\mathbf{T})) \leq \gamma^{-1}(\Omega^{\mathbf{B}}(\mathbf{T}))$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution based on $\mathbf{F}$.

- We say $\mathfrak{G}$ is **protoalgebraic** if the Leibniz operator $\Omega : \text{ThFam}(\mathfrak{G}) \rightarrow \text{ConSys}(\mathcal{F})$ is monotone on $\text{ThFam}(\mathfrak{G})$;
- We say $\mathfrak{G}$ is **syntactically protoalgebraic** if, for all $\langle m, n \rangle \in \text{tr}$, there exists $I^{\langle m, n \rangle} : (\mathbf{SEN}^b)^{\omega} \rightarrow \bigcup_{\langle k, \ell \rangle \in \text{tr}} (\mathbf{SEN}^b)^{k+\ell}$ in N^b with $(m+n) + (m+n)$ distinguished arguments, such that, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\langle \phi, \psi \rangle \in \Omega_{\Sigma}(\mathbf{T}) \quad \text{iff} \quad I_{\Sigma}^{\langle m, n \rangle}[\phi, \psi] \subseteq \mathbf{T}_{\Sigma}.$$

In this case the collection $I = \{I^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$ is called a collection of **witnessing transformations** of the syntactic protoalgebraicity of $\mathfrak{G}$.

We give an alternative characterization of syntactic protoalgebraicity that comes handy in what follows.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and tr a trace. Given $\langle m, n \rangle \in \text{tr}$, we say that a collection $I : (\mathbf{SEN}^b)^\omega \rightarrow (\mathbf{SEN}^b)^k$ of natural transformations in N^b , with $(m+n) + (m+n)$ distinguished variables is **(pairwise) permutable** if and only if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\vec{\phi}, \vec{\psi} \in \mathbf{SEN}^b(\Sigma)$ and all $\{i_1, \dots, i_{m+n}\} = \{0, \dots, m+n-1\}$,

$$I_\Sigma[\phi_{i_1}, \dots, \phi_{i_{m+n}}, \psi_{i_1}, \dots, \psi_{i_{m+n}}] = I_\Sigma[\phi_0, \dots, \phi_{(m+n)-1}, \psi_0, \dots, \psi_{(n+m)-1}].$$

When we want to refer to an arbitrary pairwise permutation of two sequences $\vec{\phi}, \vec{\psi}$ of the same length as above, we write $\vec{\phi}^\pi, \vec{\psi}^\pi$, the meaning being that $\vec{\phi}, \vec{\psi}$ have the same length and that in $\vec{\phi}^\pi, \vec{\psi}^\pi$, their elements have been permuted both by applying the same arbitrary permutation π .

Theorem 1947 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution based on $\mathbf{F}$. $\mathfrak{G}$ is syntactically protoalgebraic if and only if, for all $\langle m, n \rangle \in \text{tr}$, there exists $\hat{I}^{\langle m, n \rangle} : (\mathbf{SEN}^b)^\omega \rightarrow \bigcup_{\langle k, \ell \rangle \in \text{tr}} (\mathbf{SEN}^b)^{k+\ell}$ in N^b , with $(m+n) + (m+n)$ distinguished arguments, which is permutable, such that, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \vec{\chi} \in \mathbf{SEN}^b(\Sigma)$,*

$$\langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T}) \quad \text{iff} \quad \hat{I}_\Sigma^{\langle m, n \rangle}[\langle \phi, \vec{\chi} \rangle, \langle \psi, \vec{\chi} \rangle] \subseteq \mathbf{T}_\Sigma.$$

Proof: Suppose, first, that $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations $I = \{I^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$. For all $\langle m, n \rangle \in \text{tr}$, we symmetrize $I^{\langle m, n \rangle}$ by defining $\hat{I}^{\langle m, n \rangle}$ in N^b , with $(m+n) + (m+n)$ distinguished arguments, by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\hat{I}_\Sigma^{\langle m, n \rangle}[\phi, \psi] = \bigcup \{I_\Sigma^{\langle m, n \rangle}[\phi^\pi, \psi^\pi] : \pi \text{ a permutation}\}.$$

Then, we have, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of the same trace $\langle m, n \rangle$,

$$\begin{aligned} I_\Sigma^{\langle m, n \rangle}[\phi, \psi] \subseteq \mathbf{T}_\Sigma & \quad \text{iff} \quad \langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T}) \\ & \quad \text{iff} \quad \langle \phi^\pi, \psi^\pi \rangle \in \Omega_\Sigma(\mathbf{T}), \text{ for all } \pi, \\ & \quad \text{iff} \quad \hat{I}_\Sigma^{\langle m, n \rangle}[\phi, \psi] \subseteq \mathbf{T}_\Sigma. \end{aligned}$$

Therefore, we obtain, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \vec{\chi} \in \mathbf{SEN}^b(\Sigma)$,

$$\begin{aligned} \langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T}) & \quad \text{iff} \quad I_\Sigma^{\langle m, n \rangle}[\langle \phi, \vec{\chi} \rangle, \langle \psi, \vec{\chi} \rangle] \subseteq \mathbf{T}_\Sigma \\ & \quad \text{iff} \quad \hat{I}_\Sigma^{\langle m, n \rangle}[\langle \phi, \vec{\chi} \rangle, \langle \psi, \vec{\chi} \rangle] \subseteq \mathbf{T}_\Sigma. \end{aligned}$$

Suppose, conversely, that there exists a permutable $I = \{I^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$ that satisfies the condition in the statement of the theorem. Define a

collection $\check{I} = \{\check{I}^{(m,n)} : \langle m, n \rangle \in \text{tr}\}$ in N^b having $(m+n) + (m+n)$ distinguished arguments by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\check{I}_{\Sigma}[\phi, \psi] = \bigcup \{I_{\Sigma}^{(m,n)}[(\phi\psi)^{i+1}, (\phi\psi)^i] : i < m + n - 1\},$$

where

$$(\phi\psi)^i := \langle \phi_0, \dots, \phi_{i-1}, \psi_i, \dots, \psi_{m+n-1} \rangle.$$

Then we have, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\begin{aligned} \langle \phi, \psi \rangle \in \Omega_{\Sigma}(\mathbf{T}) & \text{ iff } \langle \phi_i, \psi_i \rangle \in \Omega_{\Sigma}(\mathbf{T}), \ i < m + n - 1, \\ & \text{ iff } I_{\Sigma}^{(m,n)}[(\phi\psi)^{i+1}, (\phi\psi)^i] \subseteq \mathbf{T}_{\Sigma}, \ i < m + n - 1, \\ & \text{ iff } \check{I}_{\Sigma}^{(m,n)}[\phi, \psi] \subseteq \mathbf{T}_{\Sigma}. \end{aligned}$$

Therefore, $\mathfrak{G}$ is syntactically protoalgebraic with witnessing transformations $\check{I}$. ■

Before embarking on a characterization of the exact relationship between syntactic protoalgebraicity and protoalgebraicity, we look at some properties related to notions that have been studied in this chapter, namely, the algebraic counterpart of a Gentzen π -institution and equivalence between Gentzen π -institutions.

The first property states that it suffices to check monotonicity of the Leibniz operator only on the filter families of algebraic systems belonging to the algebraic counterpart.

Lemma 1948 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If, for all $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle \in \text{AlgSys}(\mathfrak{G})$, $\Omega^{\mathcal{A}}$ is monotone, then $\mathfrak{G}$ is protoalgebraic.*

Proof: Suppose that $\Omega^{\mathcal{A}}$ is monotone, for all $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$ and let $\mathbf{T}, \mathbf{T}' \in \text{ThFam}(\mathfrak{G})$, such that $\mathbf{T} \leq \mathbf{T}'$. Then, by the monotonicity of the Suszko operator, $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \leq \tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}')$. Thus, the congruence system $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$ is compatible with both $\mathbf{T}$ and $\mathbf{T}'$. Hence, both $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$ and $\mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$ are $\mathfrak{G}$ -filter families of $\mathcal{F}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$, such that $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \leq \mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$. By hypothesis, since $\mathcal{F}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \in \text{AlgSys}(\mathfrak{G})$,

$$\Omega^{\mathcal{F}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})}(\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})) \leq \Omega^{\mathcal{F}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})}(\mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})).$$

Thus, applying the inverse of the quotient morphism $\langle I, \pi \rangle : \mathcal{F} \rightarrow \mathcal{F}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$, we get that

$$\pi^{-1}(\Omega^{\mathcal{F}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})}(\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}))) \leq \pi^{-1}(\Omega^{\mathcal{F}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})}(\mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}))),$$

whence, by Lemma 1946,

$$\Omega(\pi^{-1}(\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}))) \leq \Omega(\pi^{-1}(\mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}))).$$

Thus, since $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T})$ is compatible with both $\mathbf{T}$ and $\mathbf{T}'$, we get that $\Omega(\mathbf{T}) \leq \Omega(\mathbf{T}')$. Therefore, $\mathfrak{G}$ is protoalgebraic. ■

Now we prove that protoalgebraicity is preserved under equivalence.

Theorem 1949 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr, tr' , respectively, based on $\mathbf{F}$. If $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent, then $\mathfrak{G}$ is protoalgebraic if and only if $\mathfrak{G}'$ is also.*

Proof: Suppose $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$ and that $\mathfrak{G}'$ is protoalgebraic. Let $\mathbf{T}, \mathbf{T}' \in \text{ThFam}(\mathfrak{G})$, such that $\mathbf{T} \leq \mathbf{T}'$. Then, by Theorem 1917, $\rho^*(\mathbf{T}) \leq \rho^*(\mathbf{T}')$. Thus, by hypothesis, $\Omega(\rho^*(\mathbf{T})) \leq \Omega(\rho^*(\mathbf{T}'))$. Hence, by Proposition 1934, $\Omega(\mathbf{T}) \leq \Omega(\mathbf{T}')$. Therefore, $\mathfrak{G}$ is also protoalgebraic. The converse follows by the symmetry of equivalence. ■

Finally, it is shown that the same applies to syntactic protoalgebraicity, i.e., if two Gentzen π -institutions are equivalent, then one is syntactically protoalgebraic if and only if the other is also.

Theorem 1950 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr, tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr, tr' , respectively, based on $\mathbf{F}$. If $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent, then $\mathfrak{G}$ is syntactically protoalgebraic if and only if $\mathfrak{G}'$ is also.*

Proof: Suppose that $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via a conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftharpoons \mathfrak{G}'$ and that $\mathfrak{G}'$ is syntactically protoalgebraic, with witnessing transformations $I := \{I^{(m,m)} : \langle m, n \rangle \in \text{tr}'\}$. Then, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$, we get, setting, according to Theorem 1917, $\mathbf{T}' \in \text{ThFam}(\mathfrak{G}')$ be such that $\mathbf{T} \xrightarrow[\tau^*]{\rho^*} \mathbf{T}'$, and taking into account Theorem 1956,

$$\begin{aligned} \langle \phi, \psi \rangle \in \Omega_{\Sigma}(\mathbf{T}) & \text{ iff } \langle \phi, \psi \rangle \in \Omega_{\Sigma}(\rho^*(\mathbf{T})) \\ & \text{ iff } \langle \phi, \psi \rangle \in \Omega_{\Sigma}(\mathbf{T}') \\ & \text{ iff } \hat{I}_{\Sigma}[\langle \phi_i, \vec{\chi} \rangle, \langle \psi_i, \vec{\chi} \rangle] \subseteq \mathbf{T}'_{\Sigma}, i < m + n, \\ & \text{ iff } \hat{I}_{\Sigma}[\langle \phi_i, \vec{\chi} \rangle, \langle \psi_i, \vec{\chi} \rangle] \subseteq \tau_{\Sigma}^*(\mathbf{T}), i < m + n, \\ & \text{ iff } \tau_{\Sigma}[\hat{I}_{\Sigma}[\langle \phi_i, \vec{\chi} \rangle, \langle \psi_i, \vec{\chi} \rangle]] \subseteq \mathbf{T}_{\Sigma}, i < m + n. \end{aligned}$$

Therefore, $(\tau \circ \hat{I})^{\sim}$ witnesses the syntactic protoalgebraicity of $\mathfrak{G}$. The converse follows by the symmetry of equivalence. ■

It is relatively easy to see that, if a Gentzen π -institution $\mathfrak{G}$ is syntactically protoalgebraic, then it is protoalgebraic.

Theorem 1951 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is syntactically protoalgebraic, then it is protoalgebraic.*

Proof: Suppose $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations $I = \{I^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$ in N^b , and let $\mathbf{T}, \mathbf{T}' \in \text{ThFam}(\mathfrak{G})$, such that $\mathbf{T} \leq \mathbf{T}'$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of the same trace $\langle m, n \rangle$, we have

$$\begin{aligned} \langle \phi, \psi \rangle \in \Omega_{\Sigma}(\mathbf{T}) & \quad \text{iff} \quad I_{\Sigma}^{\langle m, n \rangle}[\phi, \psi] \subseteq \mathbf{T}_{\Sigma} \\ & \quad \text{implies} \quad I_{\Sigma}^{\langle m, n \rangle}[\phi, \psi] \subseteq \mathbf{T}'_{\Sigma} \\ & \quad \text{iff} \quad \langle \phi, \psi \rangle \in \Omega_{\Sigma}(\mathbf{T}'). \end{aligned}$$

Hence $\Omega(\mathbf{T}) \leq \Omega(\mathbf{T}')$ and $\mathfrak{G}$ is protoalgebraic. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. The **reflexive core** $R^{\mathfrak{G}}$ of $\mathfrak{G}$ is the collection

$$R^{\mathfrak{G}} = \{R^{\mathfrak{G}, \langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\},$$

where, for all $\langle m, n \rangle \in \text{tr}$, $R^{\mathfrak{G}, \langle m, n \rangle}$ consists of all natural transformations $\rho : (\text{SEN}^b)^{\omega} \rightarrow \bigcup_{\langle k, \ell \rangle \in \text{tr}} (\text{SEN}^b)^{k+\ell}$ in N^b with $(m+n) + (m+n)$ distinguished arguments that satisfy:

1. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \tilde{\chi} \in \text{SEN}^b(\Sigma)$,

$$\rho_{\Sigma}[\langle \phi, \tilde{\chi} \rangle, \langle \phi, \tilde{\chi} \rangle] \subseteq \text{Thm}_{\Sigma}(\mathfrak{G});$$

2. For all $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\rho_{\Sigma'}[\text{SEN}^b(f)(\phi), \text{SEN}^b(f)(\psi)] \subseteq G_{\Sigma'}(\rho_{\Sigma}[\phi, \psi]).$$

Using the notation in the proof of Theorem 1956, we observe that, $\hat{R}^{\mathfrak{G}} \subseteq R^{\mathfrak{G}}$ and that $\tilde{R}^{\mathfrak{G}} \subseteq R^{\mathfrak{G}}$:

- If $\rho \in R^{\mathfrak{G}}$, then, for

$$\sigma_{\Sigma}(\phi, \psi, \tilde{\chi}) := \rho_{\Sigma}(\phi^{\pi}, \psi^{\pi}, \tilde{\chi}),$$

$$\text{we get } \sigma_{\Sigma}[\phi, \phi] = \rho_{\Sigma}[\phi^{\pi}, \phi^{\pi}] \subseteq \text{Thm}_{\Sigma}(\mathfrak{G});$$

- If $\rho \in R^{\mathfrak{G}}$, then, for

$$\sigma_{\Sigma}(\phi, \psi, \tilde{\chi}) := \rho_{\Sigma}((\phi\psi)^{i+1}, (\phi\psi)^i, \tilde{\chi}),$$

$$\text{we get } \sigma_{\Sigma}[\phi, \phi] = \rho_{\Sigma}[\phi, \phi] \subseteq \text{Thm}_{\Sigma}(\mathfrak{G}).$$

If a Gentzen π -institution $\mathfrak{G}$ of trace tr is syntactically protoalgebraic with witnessing transformations I , then $I^{\langle m, n \rangle} \subseteq R^{\mathfrak{G}, \langle m, n \rangle}$, for all $\langle m, n \rangle \in \text{tr}$.

Lemma 1952 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is syntactically protoalgebraic with witnessing transformations $I = \{I^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$, then $I \subseteq R^\mathfrak{G}$.*

Proof: Suppose that $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations I .

- Since, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, $\langle \phi, \phi \rangle \in \Omega_\Sigma(\text{Thm}(\mathfrak{G}))$, we get that $I_\Sigma[\phi, \phi] \subseteq \text{Thm}_\Sigma(\mathfrak{G})$.
- If, for some $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, we have $I_\Sigma[\phi, \psi] \subseteq \mathbf{T}_\Sigma$, then we get $\langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T})$, whence, since $\Omega(\mathbf{T})$ is a congruence system on $\mathbf{F}$, for all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, we get $\langle \mathbf{SEN}^b(f)(\phi), \mathbf{SEN}^b(f)(\psi) \rangle \in \Omega_{\Sigma'}(\mathbf{T})$, showing that

$$I_{\Sigma'}[\mathbf{SEN}^b(f)(\phi), \mathbf{SEN}^b(f)(\psi)] \subseteq \mathbf{T}_{\Sigma'}.$$

Thus, by definition of $R^\mathfrak{G}$, we get that $I \subseteq R^\mathfrak{G}$. ■

Another important property of syntactic protoalgebraicity is that it guarantees that the reflexive core of $\mathfrak{G}$ possesses a modus ponens property in $\mathfrak{G}$.

Theorem 1953 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is syntactically protoalgebraic, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of the same trace,*

$$\psi \in G_\Sigma(\phi, R_\Sigma^\mathfrak{G}[\phi, \psi]).$$

Proof: Suppose $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations I and let $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, such that $\phi \in \mathbf{T}_\Sigma$ and $R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq \mathbf{T}_\Sigma$. Then, by Lemma 1952, we get $\phi \in \mathbf{T}_\Sigma$ and $I_\Sigma[\phi, \psi] \subseteq \mathbf{T}_\Sigma$, that is, by syntactic protoalgebraicity, $\phi \in \mathbf{T}_\Sigma$ and $\langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T})$. Therefore, by compatibility, we get $\psi \in \mathbf{T}_\Sigma$, showing that $\psi \in G_\Sigma(\phi, R_\Sigma^\mathfrak{G}[\phi, \psi])$. ■

Conversely, if the reflexive core $R^\mathfrak{G}$ of a Gentzen π -institution $\mathfrak{G}$ has the modus ponens property in $\mathfrak{G}$, then $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations $R^\mathfrak{G}$. First, a lemma of a technical nature. For a Gentzen π -institution $\mathfrak{G}$ and $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, we set

$$R^\mathfrak{G}(\mathbf{T}) = \{R_\Sigma^\mathfrak{G}(\mathbf{T})\}_{\Sigma \in |\mathbf{Sign}^b|},$$

where, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$R_\Sigma^\mathfrak{G}(\mathbf{T}) = \{\langle \phi, \psi \rangle \in \mathbf{SEN}^b(\Sigma) : (\forall \tilde{\chi} \in \mathbf{SEN}^b(\Sigma))(R_\Sigma^\mathfrak{G}[\langle \phi, \tilde{\chi} \rangle, \langle \psi, \tilde{\chi} \rangle] \subseteq \mathbf{T}_\Sigma)\}.$$

Of course, by the symmetry of the transformations in N^b , in this definition, ϕ and ψ may appear, equivalently, in any position of the sequents on the right, as long as they appear in the same position in both of the first sequent arguments of $R^\mathfrak{G}$.

Lemma 1954 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of the same trace,*

$$\psi \in G_{\Sigma}(\phi, R_{\Sigma}^{\mathfrak{G}}[\phi, \psi]),$$

the $R^{\mathfrak{G}}(\mathbf{T})$ is a congruence family on $\mathbf{F}$ compatible with $\mathbf{T}$.

Proof: We start by showing that $R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$ is an equivalence family on $\mathbf{F}$.

- By the definition of $R^{\mathfrak{G}}$, we get, for all $\phi, \bar{\chi} \in \mathbf{SEN}^b(\Sigma)$,

$$R_{\Sigma}^{\mathfrak{G}}[\langle \phi, \bar{\chi} \rangle, \langle \phi, \bar{\chi} \rangle] \subseteq \text{Thm}_{\Sigma}(\mathfrak{G}) \subseteq \mathbf{T}_{\Sigma}.$$

Thus, $\langle \phi, \phi \rangle \in R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$ and $R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$ is reflexive.

- Suppose $\langle \phi, \psi \rangle \in R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$. Then, for all $\bar{\chi} \in \mathbf{SEN}^b(\Sigma)$, we have

$$R_{\Sigma}^{\mathfrak{G}}[\langle \phi, \bar{\chi} \rangle, \langle \psi, \bar{\chi} \rangle] \subseteq \mathbf{T}_{\Sigma}.$$

But then, by the definition of $R^{\mathfrak{G}}$ and the symmetry of N^b , we get

$$R_{\Sigma}^{\mathfrak{G}}[\langle \psi, \bar{\chi} \rangle, \langle \phi, \bar{\chi} \rangle] \subseteq R_{\Sigma}^{\mathfrak{G}}[\langle \phi, \bar{\chi} \rangle, \langle \psi, \bar{\chi} \rangle] \subseteq \mathbf{T}_{\Sigma}.$$

Therefore, $\langle \psi, \phi \rangle \in R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$ and $R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$ is also symmetric.

- Suppose, now, that $\langle \phi, \psi \rangle, \langle \psi, \chi \rangle \in R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$. Thus, we get, for all $\bar{\chi} \in \mathbf{SEN}(\Sigma)$,

$$R_{\Sigma}^{\mathfrak{G}}[\langle \phi, \bar{\chi} \rangle, \langle \psi, \bar{\chi} \rangle] \subseteq \mathbf{T}_{\Sigma} \text{ and } R_{\Sigma}^{\mathfrak{G}}[\langle \psi, \bar{\chi} \rangle, \langle \chi, \bar{\chi} \rangle] \subseteq \mathbf{T}_{\Sigma}.$$

By hypothesis, we have, for all $\rho \in R^{\mathfrak{G}}$ and all $\vec{\xi} \in \mathbf{SEN}^b(\Sigma)$,

$$\begin{aligned} \rho_{\Sigma}(\langle \phi, \bar{\chi} \rangle, \langle \chi, \bar{\chi} \rangle, \vec{\xi}) &\subseteq G_{\Sigma}(\rho_{\Sigma}(\langle \phi, \bar{\chi} \rangle, \langle \psi, \bar{\chi} \rangle, \vec{\xi}), \\ &\quad R_{\Sigma}^{\mathfrak{G}}[\rho_{\Sigma}(\langle \phi, \bar{\chi} \rangle, \langle \psi, \bar{\chi} \rangle, \vec{\xi}), \rho_{\Sigma}(\langle \phi, \bar{\chi} \rangle, \langle \chi, \bar{\chi} \rangle, \vec{\xi})]) \\ &\subseteq G_{\Sigma}(R_{\Sigma}^{\mathfrak{G}}[\langle \phi, \bar{\chi} \rangle, \langle \psi, \bar{\chi} \rangle], R_{\Sigma}^{\mathfrak{G}}[\langle \psi, \bar{\chi} \rangle, \langle \chi, \bar{\chi} \rangle]) \\ &\subseteq G_{\Sigma}(\mathbf{T}_{\Sigma}) = \mathbf{T}_{\Sigma}. \end{aligned}$$

Therefore, $R_{\Sigma}^{\mathfrak{G}}[\langle \phi, \bar{\chi} \rangle, \langle \chi, \bar{\chi} \rangle] \subseteq \mathbf{T}_{\Sigma}$, showing that $\langle \phi, \chi \rangle \in R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$ and, hence, $R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$ is also transitive.

We show, next, that $R^{\mathfrak{G}}(\mathbf{T})$ is a congruence family. Let σ be in N^b , $\vec{\phi}, \vec{\psi} \in \mathbf{SEN}^b(\Sigma)$, such that, for all $i < k$, $\langle \phi_i, \psi_i \rangle \in R_{\Sigma}^{\mathfrak{G}}(\mathbf{T})$. Then, for all $i < k$ and all $\bar{\chi} \in \mathbf{SEN}^b(\Sigma)$, $R_{\Sigma}^{\mathfrak{G}}[\langle \phi_i, \bar{\chi} \rangle, \langle \psi_i, \bar{\chi} \rangle] \subseteq \mathbf{T}_{\Sigma}$. But, then, for all $i < k$,

$$R_{\Sigma}^{\mathfrak{G}}[\langle \sigma_{\Sigma}((\vec{\phi}\vec{\psi})^{i+1}), \bar{\chi} \rangle, \langle \sigma_{\Sigma}((\vec{\phi}\vec{\psi})^i), \bar{\chi} \rangle] \subseteq R_{\Sigma}^{\mathfrak{G}}[\langle \phi_i, \bar{\chi} \rangle, \langle \psi_i, \bar{\chi} \rangle] \subseteq \mathbf{T}_{\Sigma},$$

i.e., $\langle \sigma_\Sigma((\vec{\phi}\vec{\psi})^{i+1}), \sigma_\Sigma((\vec{\phi}\vec{\psi})^i) \rangle \in R_\Sigma^\mathfrak{G}(\mathbf{T})$. Since this holds for all $i < k$, we get by the transitivity of $R^\mathfrak{G}(\mathbf{T})$ proven above, that $\langle \sigma_\Sigma(\vec{\phi}), \sigma_\Sigma(\vec{\psi}) \rangle \in R_\Sigma^\mathfrak{G}(\mathbf{T})$ and, therefore, $R^\mathfrak{G}(\mathbf{T})$ is also a congruence family.

Finally, $R^\mathfrak{G}(\mathbf{T})$ is a congruence system by the definition of $R^\mathfrak{G}$. Compatibility of $R^\mathfrak{G}(\mathbf{T})$ with $\mathbf{T}$ is also readily obtainable by the hypothesis, since $\langle \phi, \psi \rangle \in R_\Sigma^\mathfrak{G}(\mathbf{T})$ implies $R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq \mathbf{T}_\Sigma$. Therefore, if $\phi \in T_\Sigma$ and $\langle \phi, \psi \rangle \in R_\Sigma^\mathfrak{G}(\mathbf{T})$, we get

$$\psi \in G_\Sigma(\phi, R_\Sigma^\mathfrak{G}[\phi, \psi]) \subseteq G_\Sigma(\mathbf{T}_\Sigma) = \mathbf{T}_\Sigma.$$

Hence, $R^\mathfrak{G}(\mathbf{T})$ is a congruence system on $\mathbf{F}$ compatible with $\mathbf{T}$. $\blacksquare$

Now we are ready for the promised theorem.

Theorem 1955 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of the same trace,*

$$\psi \in G_\Sigma(\phi, R_\Sigma^\mathfrak{G}[\phi, \psi]),$$

then $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations $R^\mathfrak{G}$.

Proof: Suppose that $R^\mathfrak{G}$ satisfies the displayed condition. We must show that, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$,

$$\langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T}) \quad \text{iff} \quad R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq \mathbf{T}_\Sigma.$$

Suppose, first, that $\langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T})$. Then, since $\Omega(\mathbf{T})$ is a congruence system on $\mathbf{F}$, we get, for all $\rho \in R^\mathfrak{G}$ and all $\vec{\chi} \in \mathbf{SEN}^b(\Sigma)$,

$$\langle \rho_\Sigma(\phi, \phi, \vec{\chi}), \rho_\Sigma(\phi, \psi, \vec{\chi}) \rangle \in \Omega_\Sigma(\mathbf{T}).$$

Moreover, $R_\Sigma^\mathfrak{G}[\phi, \phi] \subseteq \text{Thm}_\Sigma(\mathfrak{G}) \subseteq \mathbf{T}_\Sigma$, by the definition of the reflexive core. Therefore, by the compatibility of $\Omega(\mathbf{T})$, with $\mathbf{T}$, we get that, for all $\rho \in R^\mathfrak{G}$ and all $\vec{\chi} \in \mathbf{SEN}^b(\Sigma)$, $\rho_\Sigma(\phi, \psi, \vec{\chi}) \in \mathbf{T}_\Sigma$. We conclude that $R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq \mathbf{T}_\Sigma$.

Assume, conversely, that $R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq \mathbf{T}_\Sigma$. Since, by Lemma 1954, $R^\mathfrak{G}(\mathbf{T})$ is a congruence system on $\mathbf{F}$ compatible with $\mathbf{T}$, we get, by the maximality of $\Omega(\mathbf{T})$, that $R^\mathfrak{G}(\mathbf{T}) \leq \Omega(\mathbf{T})$. But the hypothesis implies that $\langle \phi, \psi \rangle \in R_\Sigma^\mathfrak{G}(\mathbf{T})$. Therefore, we conclude that $\langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T})$. $\blacksquare$

We now have a characterization of syntactic protoalgebraicity in terms of the property of modus ponens of the reflexive core $R^\mathfrak{G}$ of the Gentzen π -institution $\mathfrak{G}$.

$\mathfrak{G}$ is syntactically protoalgebraic $\longleftrightarrow R^\mathfrak{G}$ has the MP.

Theorem 1956 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is syntactically protoalgebraic if and only if $R^\mathfrak{G}$ has the modus ponens in $\mathfrak{G}$.*

Proof: Theorem 1953 gives the “only if” and the “if” is by Theorem 1955. ■

As a corollary, we obtain

Corollary 1957 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is syntactically protoalgebraic with witnessing transformations $I = \{I^{(m,n)} : \langle m, n \rangle \in \text{tr}\}$, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,*

$$G_{\Sigma}(R_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi, \psi]) = G_{\Sigma}(I_{\Sigma}^{\langle m, n \rangle}[\phi, \psi]).$$

Proof: If $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations I , then, by Theorems 1956 and 1955, both I and $R^{\mathfrak{G}}$ are families of witnessing transformations for the syntactic protoalgebraicity of $\mathfrak{G}$. Therefore, for all $T \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\begin{aligned} R_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi, \psi] \subseteq T_{\Sigma} & \text{ iff } \langle \phi, \psi \rangle \in \Omega_{\Sigma}(T) \\ & \text{ iff } I_{\Sigma}^{\langle m, n \rangle}[\phi, \psi] \subseteq T_{\Sigma}. \end{aligned}$$

Therefore, $G_{\Sigma}(R_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi, \psi]) = G_{\Sigma}(I_{\Sigma}^{\langle m, n \rangle}[\phi, \psi])$. ■

We get relatively easily another related characterization of syntactic protoalgebraicity.

$\mathfrak{G}$ is syntactically protoalgebraic

$$\longleftrightarrow R^{\mathfrak{G}} \text{ Defines Leibniz Congruence Systems.}$$

Theorem 1958 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is syntactically protoalgebraic if and only if, for every $T \in \text{ThFam}(\mathfrak{G})$,*

$$\Omega(T) = R^{\mathfrak{G}}(T).$$

Proof: If $\mathfrak{G}$ is syntactically protoalgebraic, then, by Theorems 1956 and 1955, $R^{\mathfrak{G}}$ constitutes a collection of witnessing transformations, whence, for every $T \in \text{ThFam}(\mathfrak{G})$ $\Omega(T) = \hat{R}^{\mathfrak{G}}(T) = R^{\mathfrak{G}}(T)$.

The converse follows by the definition of syntactic protoalgebraicity, since, in that case, $\hat{R}^{\mathfrak{G}} = R^{\mathfrak{G}}$ forms a collection of witnessing transformations. ■

We finally show that the property that separates protoalgebraicity from syntactic protoalgebraicity is the compatibility property with respect to the theory family generated by the reflexive core.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. We say that the reflexive core $R^{\mathfrak{G}}$ is **Leibniz** if, for all $T \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\phi \Omega_{\Sigma}(G(R_{\Sigma}^{\mathfrak{G}}[\phi, \psi])) \psi.$$

This property is weaker than $R^{\mathfrak{G}}$ having the modus ponens, i.e., if $R^{\mathfrak{G}}$ has the modus ponens, then it is Leibniz.

Proposition 1959 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $R^\mathfrak{G}$ has the modus ponens, then it is Leibniz.*

Proof: If $R^\mathfrak{G}$ has the modus ponens, then, by Theorem 1956, we get, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle \in \text{tr}$,

$$\phi \Omega_\Sigma(\mathbf{T}) \psi \quad \text{iff} \quad R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq \mathbf{T}_\Sigma.$$

Therefore, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$, by considering, in particular, $\mathbf{T} = G(R_\Sigma^\mathfrak{G}[\phi, \psi])$, and taking into account that

$$R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq G_\Sigma(R_\Sigma^\mathfrak{G}[\phi, \psi]),$$

we get that $\phi \Omega_\Sigma(G(R_\Sigma^\mathfrak{G}[\phi, \psi])) \psi$. Thus, $R^\mathfrak{G}$ is Leibniz. $\blacksquare$

In the opposite direction, in a protoalgebraic Gentzen π -institution $\mathfrak{G}$, if the reflexive core $R^\mathfrak{G}$ is Leibniz, then it has the modus ponens in $\mathfrak{G}$.

Proposition 1960 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a protoalgebraic Gentzen π -institution of trace tr based on $\mathbf{F}$. If $R^\mathfrak{G}$ is Leibniz, then it has the modus ponens in $\mathfrak{G}$.*

Proof: Suppose that $\mathfrak{G}$ is protoalgebraic and that $R^\mathfrak{G}$ is Leibniz. Let $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle \in \text{tr}$, such that $\phi \in \mathbf{T}_\Sigma$ and $R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq \mathbf{T}_\Sigma$. Since $R^\mathfrak{G}$ is Leibniz, we have

$$\phi \Omega_\Sigma(G(R_\Sigma^\mathfrak{G}[\phi, \psi])) \psi,$$

whence, since $\mathfrak{G}$ is protoalgebraic and $R_\Sigma^\mathfrak{G}[\phi, \psi] \subseteq \mathbf{T}_\Sigma$, we get $\phi \Omega_\Sigma(\mathbf{T}) \psi$. Therefore, since $\phi \in \mathbf{T}_\Sigma$, we get, by the compatibility of $\Omega(\mathbf{T})$ with $\mathbf{T}$, that $\psi \in \mathbf{T}_\Sigma$. We conclude that $R^\mathfrak{G}$ has the modus ponens in $\mathfrak{G}$. $\blacksquare$

We now show that a Gentzen π -institution is syntactically protoalgebraic if and only if it is protoalgebraic and it has a Leibniz reflexive core.

$$\begin{aligned} \text{Syntactic Protoalgebraicity} &= R^\mathfrak{G} \text{ has the Modus Ponens} \\ &= R^\mathfrak{G} \text{ Defines Leibniz Congruence Systems} \\ &= \text{Protoalgebraicity} + R^\mathfrak{G} \text{ Leibniz} \end{aligned}$$

Theorem 1961 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathcal{I}$ is syntactically protoalgebraic if and only if it is protoalgebraic and has a Leibniz reflexive core.*

Proof: Suppose, first, that $\mathfrak{G}$ is syntactically protoalgebraic. Then it is protoalgebraic by Theorem 1951. Moreover, its reflexive core has the modus ponens by Theorem 1953 and, hence, by Proposition 1959, its reflexive core is Leibniz.

Suppose, conversely, that $\mathfrak{G}$ is protoalgebraic with a Leibniz reflexive core. Then, by Proposition 1960, its reflexive core has the modus ponens and, therefore, by Theorem 1956, $\mathfrak{G}$ is syntactically protoalgebraic. $\blacksquare$

26.8 Order Algebraizability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. Recall the inequational π -institution $\mathcal{I}^{\mathbf{K}} = \langle \mathbf{F}, C^{\mathbf{K}} \rangle$ associated with the class $\mathbf{K}$, i.e., in which, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $I \cup \{\phi \leq \psi\} \subseteq \text{In}_{\Sigma}(\mathbf{F})$,

$$\begin{aligned} \phi \leq \psi \in C_{\Sigma}^{\mathbf{K}}(I) \quad \text{iff} \quad & \text{for all } \langle \mathcal{A}, \leq \rangle \in \mathbf{K}, \Sigma' \in |\mathbf{Sign}^b|, f \in \mathbf{Sign}^b(\Sigma, \Sigma'), \\ & \alpha_{\Sigma'}(\mathbf{SEN}^b(f)(I)) \subseteq \leq_{F(\Sigma')} \text{ implies} \\ & \alpha_{\Sigma'}(\mathbf{SEN}^b(f)(\phi)) \leq_{F(\Sigma')} \alpha_{\Sigma'}(\mathbf{SEN}^b(f)(\psi)). \end{aligned}$$

To $\mathcal{I}^{\mathbf{K}}$ we associate the Gentzen π -institution $\mathfrak{G}^{\mathbf{K}} = \langle \mathbf{F}, G^{\mathbf{K}} \rangle$ of trace $\{\langle 1, 1 \rangle\}$ defined by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\{\phi_i, \psi_i : i \in I\} \cup \{\phi, \psi\} \subseteq \mathbf{SEN}^b(\Sigma)$,

$$\phi \triangleright_{\Sigma} \psi \in G_{\Sigma}^{\mathbf{K}}(\{\phi_i \triangleright_{\Sigma} \psi_i : i \in I\}) \quad \text{iff} \quad \phi \leq \psi \in C_{\Sigma}^{\mathbf{K}}(\{\phi_i \leq \psi_i : i \in I\}).$$

We call $\mathfrak{G}^{\mathbf{K}}$ the **inequational Gentzen π -institution associated with $\mathbf{K}$** .

It turns out that, for every class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems, the associated inequational Gentzen π -institution $\mathfrak{G}^{\mathbf{K}}$ is syntactically protoalgebraic.

Theorem 1962 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic posystems. Then $\mathfrak{G}^{\mathbf{K}} = \langle \mathbf{F}, G^{\mathbf{K}} \rangle$ is syntactically protoalgebraic.*

Proof: Consider $I = \{I^{(1,1)}\}$, where $I^{(1,1)} : (\mathbf{SEN}^b)^4 \rightarrow (\mathbf{SEN}^b)^2$ is given, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \phi', \psi' \in \mathbf{SEN}^b(\Sigma)$, by

$$I_{\Sigma}^{(1,1)}[\langle \phi, \psi \rangle, \langle \phi', \psi' \rangle] = \{\phi \triangleright_{\Sigma} \phi', \phi' \triangleright_{\Sigma} \phi, \psi \triangleright_{\Sigma} \psi', \psi' \triangleright_{\Sigma} \psi\}.$$

Then, we have, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G}^{\mathbf{K}})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \triangleright_{\Sigma} \psi \in \text{Seq}_{\Sigma}^{\{\langle 1, 1 \rangle\}}(\mathbf{F})$,

$$\begin{aligned} \langle \phi, \phi' \rangle, \langle \psi, \psi' \rangle \in \Omega_{\Sigma}(\mathbf{T}) \quad \text{iff} \quad & \{\phi \triangleright_{\Sigma} \phi', \phi' \triangleright_{\Sigma} \phi, \psi \triangleright_{\Sigma} \psi', \psi' \triangleright_{\Sigma} \psi\} \subseteq \mathbf{T}_{\Sigma} \\ \text{iff} \quad & I_{\Sigma}^{(1,1)}[\phi \triangleright_{\Sigma} \psi, \phi' \triangleright_{\Sigma} \psi'] \subseteq \mathbf{T}_{\Sigma}. \end{aligned}$$

Therefore, $\mathfrak{G}^{\mathbf{K}}$ is syntactically protoalgebraic, with witnessing transformations I . ■

Note, also, how $I^{(1,1)}$ satisfies the modus ponens property in $\mathfrak{G}^{\mathbf{K}}$, i.e., for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \phi', \psi' \in \mathbf{SEN}^b(\Sigma)$,

$$\phi' \triangleright_{\Sigma} \psi' \in G_{\Sigma}^{\mathbf{K}}(\phi \triangleright_{\Sigma} \psi, I_{\Sigma}^{(1,1)}[\phi \triangleright_{\Sigma} \psi, \phi' \triangleright_{\Sigma} \psi']).$$

We now show that, if the class $\mathbf{K}$ happens to be an order quasivariety of $\mathbf{F}$ -algebraic posystems, then the Leibniz reduced $\mathfrak{G}^{\mathbf{K}}$ -matrix families coincide with the class $\mathbf{K}$.

Proposition 1963 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system and $\mathbf{K}$ an ordered quasivariety of $\mathbf{F}$ -algebraic posystems. Then $\text{MatFam}^*(\mathfrak{G}^{\mathbf{K}}) = \mathbf{K}$.*

Proof: Suppose $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$ and let $\Sigma \in |\mathbf{Sign}|$ $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\langle \phi, \psi \rangle \in \Omega_{\Sigma}^{\mathcal{A}}(\leq)$. Since $\phi \leq_{\Sigma} \phi$, we get, by compatibility of $\Omega^{\mathcal{A}}(\leq)$ with $\leq$, that $\phi \leq_{\Sigma} \psi$ and $\psi \leq_{\Sigma} \phi$. Thus, since $\leq$ is a posystem on $\mathcal{A}$ and, therefore, antisymmetric, we get that $\phi = \psi$. Hence, $\Omega^{\mathcal{A}}(\leq) = \Delta^{\mathcal{A}}$. We conclude that $\langle \mathcal{A}, \leq \rangle \in \text{MatFam}^*(\mathfrak{G}^{\mathbf{K}})$. Thus, $\mathbf{K} \subseteq \text{MatFam}^*(\mathfrak{G}^{\mathbf{K}})$.

Suppose, conversely, that $\langle \mathcal{A}, \leq \rangle \in \text{MatFam}^*(\mathfrak{G}^{\mathbf{K}})$. Then $\Omega^{\mathcal{A}}(\leq) = \Delta^{\mathcal{A}}$. Since $\mathbf{K}$ is a class of $\mathbf{F}$ -algebraic posystems, we get that, for all σ, τ in N^b , all $\Sigma, \Sigma' \in |\mathbf{Sign}|$, all $f \in |\mathbf{Sign}(\Sigma, \Sigma')|$ and all $\phi, \psi, \bar{\chi} \in \text{SEN}(\Sigma')$,

$$\begin{aligned} \sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}^b(f)(\psi), \bar{\chi}) &\leq_{\Sigma'} \tau_{\Sigma'}^{\mathcal{A}}(\text{SEN}^b(f)(\psi), \bar{\chi}) \\ &\in G_{\Sigma'}^{\mathbf{K}, \mathcal{A}}(\phi \leq_{\Sigma} \psi, \psi \leq_{\Sigma} \phi, \sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}^b(f)(\phi), \bar{\chi}) \leq_{\Sigma'} \tau_{\Sigma'}^{\mathcal{A}}(\text{SEN}^b(f)(\phi), \bar{\chi})). \end{aligned}$$

Therefore, if $\phi \leq_{\Sigma} \psi$ and $\psi \leq_{\Sigma} \phi$, then we get that $\langle \phi, \psi \rangle \in \Omega_{\Sigma}^{\mathcal{A}}(\leq) = \Delta_{\Sigma}^{\mathcal{A}}$, i.e., that $\phi = \psi$. Therefore, $\leq$ is antisymmetric, i.e., $\langle \mathcal{A}, \leq \rangle \in \text{GO}^{\text{Sem}}(\mathbf{K}) = \mathbf{K}$. We conclude that $\text{MatFam}^*(\mathfrak{G}^{\mathbf{K}}) \subseteq \mathbf{K}$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is **order algebraizable** if it is equivalent to the inequational Gentzen π -institution $\mathfrak{G}^{\mathbf{K}}$ associated with some class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems.

Order algebraizability implies protoalgebraicity.

Proposition 1964 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is order algebraizable, then it is protoalgebraic.*

Proof: Suppose that $\mathfrak{G}$ is equivalent to $\mathfrak{G}^{\mathbf{K}}$, for some class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems. Then, since, by Theorem 1962, $\mathfrak{G}^{\mathbf{K}}$ is syntactically protoalgebraic, it is, by Theorem 1951, protoalgebraic. Therefore, by Theorem 1949, $\mathfrak{G}$ is protoalgebraic as well. ■

The following result provides a characterization of order algebraizability.

Theorem 1965 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is order algebraizable if and only if there exist a $\text{tr}\text{-}\{\langle 1, 1 \rangle\}$ -transformation τ and an $\{\langle 1, 1 \rangle\}$ - tr -transformation ρ , such that, for all σ, σ' in N^b , all $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, all $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$, all $\bar{\chi} \in \text{SEN}^b(\Sigma')$, all $\{\phi_i, \psi_i : i \in I\} \subseteq \text{SEN}^b(\Sigma)$, and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$:*

- (1) $\rho_{\Sigma}[\phi, \phi] \subseteq \text{Thm}_{\Sigma}(\mathfrak{G})$;
- (2) $\rho_{\Sigma}[\phi, \chi] \subseteq G_{\Sigma}(\rho_{\Sigma}[\phi, \psi], \rho_{\Sigma}[\psi, \chi])$;
- (3) $\rho_{\Sigma}[\sigma_{\Sigma}(\psi, \bar{\chi}), \sigma'_{\Sigma}(\psi, \bar{\chi})] \subseteq G_{\Sigma}(\rho_{\Sigma}[\phi, \psi], \rho_{\Sigma}[\psi, \phi], \rho_{\Sigma}[\sigma_{\Sigma}(\phi, \bar{\chi}), \sigma'_{\Sigma}(\phi, \bar{\chi})])$;

(4) $\rho_\Sigma[\phi, \psi] \subseteq G_\Sigma(\bigcup_{i \in I} \rho_\Sigma[\phi_i, \psi_i])$ implies

$$\rho_{\Sigma'}[\text{SEN}^b(f)(\phi), \text{SEN}^b(f)(\psi)] \subseteq G_{\Sigma'}(\bigcup_{i \in I} \rho_{\Sigma'}[\text{SEN}^b(f)(\phi_i), \text{SEN}^b(f)(\psi_i)]);$$

(5) $G_\Sigma(\phi) = G_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]])$.

Proof: Suppose, first, that $\mathfrak{G}$ is order algebraizable. Then there exist τ and ρ as postulated and a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems, such that $\mathfrak{G}$ is equivalent to $\mathfrak{G}^{\mathbf{K}}$ via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}^{\mathbf{K}}$. Since, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{SEN}^b(\Sigma)$, $\phi \triangleright_\Sigma \phi \in \text{Thm}_\Sigma(\mathfrak{G}^{\mathbf{K}})$, we get that $\rho_\Sigma[\phi, \phi] \subseteq \text{Thm}_\Sigma(\mathfrak{G})$. So Condition (1) holds. Since, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$, $\phi \triangleright_\Sigma \chi \in G_\Sigma^{\mathbf{K}}(\phi \triangleright \psi, \psi \triangleright_\Sigma \chi)$, we get that

$$\rho_\Sigma[\phi, \chi] \subseteq G_\Sigma(\rho_\Sigma[\phi, \psi], \rho_\Sigma[\psi, \chi]).$$

Hence, Condition (2) is also satisfied. If, for some $\langle \mathcal{A}, \leq \rangle \in \mathbf{K}$, we have, for some $\Sigma \in |\mathbf{Sign}^b|$ and some $\phi, \psi \in \text{SEN}(\Sigma)$, $\phi \leq_\Sigma \psi$ and $\psi \leq_\Sigma \phi$, then, since $\mathbf{K}$ is a class of $\mathbf{F}$ -algebraic posystems, we get that $\phi = \psi$. Hence, it follows that, if, for σ, σ' in N^b , and $\vec{\chi} \in \text{SEN}(\Sigma)$, $\sigma_\Sigma^{\mathcal{A}}(\phi, \vec{\chi}) \leq_\Sigma \sigma_\Sigma^{\mathcal{A}}(\psi, \vec{\chi})$, then, we will also have $\sigma_\Sigma^{\mathcal{A}}(\psi, \vec{\chi}) \leq_\Sigma \sigma_\Sigma^{\mathcal{A}}(\phi, \vec{\chi})$. In other words, we get that, for all σ, σ' in N^b , all $\Sigma \in |\mathbf{Sign}^b|$, and all $\phi, \psi, \vec{\chi} \in \text{SEN}^b(\Sigma)$,

$$\sigma_\Sigma(\psi, \vec{\chi}) \triangleright_\Sigma \sigma'_\Sigma(\psi, \vec{\chi}) \in G_\Sigma^{\mathbf{K}}(\phi \triangleright_\Sigma \psi, \psi \triangleright_\Sigma \phi, \sigma_\Sigma(\phi, \vec{\chi}) \triangleright_\Sigma \sigma'_\Sigma(\phi, \vec{\chi})).$$

Again, by applying ρ we get that Condition (3) holds. Suppose, now, that for some $\Sigma \in |\mathbf{Sign}^b|$ and $\{\phi_i, \psi_i : i \in I\} \cup \{\phi, \psi\} \subseteq \text{SEN}^b(\Sigma)$, $\rho_\Sigma[\phi, \psi] \subseteq G_\Sigma(\bigcup_{i \in I} \rho_\Sigma[\phi_i, \psi_i])$. Then, we get $\phi \triangleright_\Sigma \psi \in G_\Sigma^{\mathbf{K}}(\{\phi_i \triangleright_\Sigma \psi_i : i \in I\})$. Therefore, since $\mathfrak{G}^{\mathbf{K}}$ is structural, for all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$,

$$\text{SEN}^b(f)(\phi \triangleright_\Sigma \psi) \in G_{\Sigma'}^{\mathbf{K}}(\{\text{SEN}^b(f)(\phi_i \triangleright_\Sigma \psi_i) : i \in I\}).$$

By applying ρ again, we get that Condition (4) holds. Finally, Condition (5) holds directly by the definition of equivalence.

Assume, conversely, that ρ and τ , as postulated in the statement, exist and that they satisfy Conditions (1)-(5). Define $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ of trace $\{\langle 1, 1 \rangle\}$ by setting, for all $\Sigma' \in |\mathbf{Sign}^b|$ and all $\{\phi_i, \psi_i : i \in I\} \cup \{\phi, \psi\} \subseteq \text{SEN}^b(\Sigma)$,

$$\phi \triangleright_\Sigma \psi \in G'_\Sigma(\{\phi_i \triangleright_\Sigma \psi_i : i \in I\}) \quad \text{iff} \quad \rho_\Sigma[\phi, \psi] \subseteq G_\Sigma(\bigcup_{i \in I} \rho_\Sigma[\phi_i, \psi_i]).$$

Then, by the fact that $\mathfrak{G}$ is a Gentzen π -institution and Property (4), we get that $\mathfrak{G}'$ is also a Gentzen π -institution. Moreover, by its definition and Condition (5), taking into account Lemma 1916, $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$ is an equivalence. Thus, it suffices to show that $\mathfrak{G}' = \mathfrak{G}^{\mathbf{K}}$, for some class $\mathbf{K}$ of $\mathbf{F}$ -algebraic posystems. For this, in turn, it suffices, by Theorem 1938, to show that $\text{MatFam}^{\text{Su}}(\mathfrak{G}')$ is a class of $\mathbf{F}$ -algebraic posystems.

Note, first, that $I = \{I^{(1,1)}\}$, defined by setting, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi, \phi', \psi' \in \text{SEN}^b(\Sigma)$,

$$I_{\Sigma}^{(1,1)}[\langle \phi, \psi \rangle, \langle \phi', \psi' \rangle] := \{\phi \triangleright_{\Sigma} \phi', \phi' \triangleright_{\Sigma} \phi, \psi \triangleright_{\Sigma} \psi', \psi' \triangleright_{\Sigma} \psi\}$$

is a subset of $R^{\mathfrak{G}'}$, which, by Condition (2) and the definition of $\mathfrak{G}'$ satisfies the Modus Ponens in $\mathfrak{G}'$. Therefore, by Theorem 1955, $\mathfrak{G}'$ is syntactically protoalgebraic and, hence, by Theorem 1951, it is protoalgebraic. Thus, by Lemma 1936, the Leibniz and the Suszko operator coincide. Moreover, by Conditions (1) and (2) and the definition of $\mathfrak{G}'$, for all $\langle \mathcal{A}, \leq \rangle \in \text{MatFam}(\mathfrak{G}')$, the relation family $\leq$ is reflexive and transitive. Also, by Condition (3) and the definition of $\mathfrak{G}'$, we get that, for all $\langle \mathcal{A}, \leq \rangle \in \text{MatFam}(\mathfrak{G}')$, all σ, σ' in N^b , all $\Sigma \in |\mathbf{Sign}|$ and all $\phi, \psi, \bar{\chi} \in \text{SEN}(\Sigma)$,

$$\phi \leq_{\Sigma} \psi, \psi \leq_{\Sigma} \phi, \sigma_{\Sigma}^A(\phi, \bar{\chi}) \leq_{\Sigma} \sigma_{\Sigma}^A(\psi, \bar{\chi}) \text{ imply } \sigma_{\Sigma}^A(\psi, \bar{\chi}) \leq_{\Sigma} \sigma_{\Sigma}^A(\phi, \bar{\chi}).$$

We finish the proof by showing that, for all $\langle \mathcal{A}, \leq \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G}')$, $\leq$ is also antisymmetric. To this end, let $\Sigma \in |\mathbf{Sign}|$, $\phi, \psi \in \text{SEN}(\Sigma)$, such that $\phi \leq_{\Sigma} \psi$ and $\psi \leq_{\Sigma} \phi$. Then, by Property (4) and the definition of $\mathfrak{G}'$, we get that, for all $\Sigma' \in |\mathbf{Sign}|$ and all $f \in \mathbf{Sign}(\Sigma, \Sigma')$,

$$\text{SEN}(f)(\phi) \leq_{\Sigma'} \text{SEN}(f)(\psi) \text{ and } \text{SEN}(f)(\psi) \leq_{\Sigma'} \text{SEN}(f)(\phi).$$

Then, by what was shown above, we have, for all σ, σ' in N^b and all $\bar{\chi} \in \text{SEN}(\Sigma')$,

$$\begin{aligned} \sigma_{\Sigma'}^A(\text{SEN}(f)(\phi), \bar{\chi}) &\leq_{\Sigma'} \sigma_{\Sigma'}^A(\text{SEN}(f)(\psi), \bar{\chi}) \\ \text{iff } \sigma_{\Sigma'}^A(\text{SEN}(f)(\psi), \bar{\chi}) &\leq_{\Sigma'} \sigma_{\Sigma'}^A(\text{SEN}(f)(\phi), \bar{\chi}). \end{aligned}$$

Therefore, by Corollary 1933, we get $\langle \phi, \psi \rangle \in \Omega_{\Sigma}^A(\leq) = \tilde{\Omega}_{\Sigma}^{\mathfrak{G}', A}(\leq) = \Delta_{\Sigma}^A$. We conclude that $\langle \mathcal{A}, \leq \rangle$ is indeed an $\mathbf{F}$ -algebraic posystem. Hence, $\mathfrak{G}'$ is an inequational Gentzen π -institution associated with the class $\text{MatFam}^{\text{Su}}(\mathfrak{G}')$ of $\mathbf{F}$ -algebraic posystems and, as a consequence, the Gentzen π -institution $\mathfrak{G}$ is indeed order algebraizable. $\blacksquare$

Specializing Theorem 1965 to the case of Hilbert π -institutions, we get

Corollary 1966 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system and $\mathfrak{H} = \langle \mathbf{F}, H \rangle$ a Hilbert π -institution based on $\mathbf{F}$. $\mathfrak{H}$ is order algebraizable if and only if there exist a $\{\langle 0, 1 \rangle\}$ - $\{\langle 1, 1 \rangle\}$ -transformation τ and an $\{\langle 1, 1 \rangle\}$ - $\{\langle 0, 1 \rangle\}$ -transformation ρ , such that, for all σ, σ' in N^b , all $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, all $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$ all $\bar{\chi} \in \text{SEN}^b(\Sigma')$ and all $\{\phi_i, \psi_i : i \in I\} \subseteq \text{SEN}^b(\Sigma)$:*

- (1) $\rho_{\Sigma}[\phi, \phi] \subseteq \text{Thm}_{\Sigma}(\mathfrak{H})$;
- (2) $\rho_{\Sigma}[\phi, \chi] \subseteq H_{\Sigma}(\rho_{\Sigma}[\phi, \psi], \rho_{\Sigma}[\psi, \chi])$;

- (3) $\rho_\Sigma[\sigma_\Sigma(\psi, \bar{\chi}), \sigma'_\Sigma(\psi, \bar{\chi})] \subseteq H_\Sigma(\rho_\Sigma[\phi, \psi], \rho_\Sigma[\psi, \phi], \rho_\Sigma[\sigma_\Sigma(\phi, \bar{\chi}), \sigma'_\Sigma(\phi, \bar{\chi})]);$
- (4) $\rho_\Sigma[\phi, \psi] \subseteq H_\Sigma(\bigcup_{i \in I} \rho_\Sigma[\phi_i, \psi_i])$ implies
- $$\rho_{\Sigma'}[\text{SEN}^b(f)(\phi), \text{SEN}^b(f)(\psi)] \subseteq H_{\Sigma'}(\bigcup_{i \in I} \rho_{\Sigma'}[\text{SEN}^b(f)(\phi_i), \text{SEN}^b(f)(\psi_i)]);$$
- (5) $H_\Sigma(\triangleright_\Sigma \phi) = H_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]]).$

Proof: Directly from Theorem 1965. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is **simply order algebraizable** if it is equivalent to the inequational Gentzen π -institution $\mathfrak{G}^K$, associated with some class K of $\mathbf{F}$ -algebraic posystems, via a conjugate pair $(\tau, \rho^0) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$, where, as before, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$\rho_\Sigma^0(\phi; \psi) = \phi \triangleright_\Sigma \psi.$$

We have the following analog of Lemma 1860.

Lemma 1967 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is simply order algebraizable via both $(\tau, \rho^0) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$ and $(\tau', \rho^0) : \mathfrak{G} \rightleftarrows \mathfrak{G}^{K'}$, then $\text{GO}^{\text{Sem}}(K) = \text{GO}^{\text{Sem}}(K')$.*

Proof: Suppose $\mathfrak{G}$ is simply order algebraizable via both $(\tau, \rho^0) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$ and $(\tau', \rho^0) : \mathfrak{G} \rightleftarrows \mathfrak{G}^{K'}$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $I \cup \{\phi \leq \psi\} \subseteq \text{In}_\Sigma(\mathbf{F})$, we have

$$\begin{aligned} \phi \leq \psi \in G_\Sigma^K(I) & \text{ iff } \rho_\Sigma^0[\phi; \psi] \subseteq G_\Sigma(\rho_\Sigma^0[I]) \\ & \text{ iff } \phi \leq \psi \in G_\Sigma^{K'}(I). \end{aligned}$$

Thus, K and K' satisfy exactly the same $\mathbf{F}$ -guasiinequations. ■

The unique order guasivariety K that simply order algebraizes a simply order algebraizable Gentzen π -institution $\mathfrak{G}$ is called the **order class of $\mathfrak{G}$** .

Specializing Theorem 1965, we get

Corollary 1968 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace, with $\langle 1, 1 \rangle \in \text{tr}$, and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is simply order algebraizable if and only if there exists a $\text{tr}\text{-}\{\langle 1, 1 \rangle\}$ -transformation τ , such that, for all σ, σ' in N^b , all $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, all $\phi, \psi, \chi \in \text{SEN}^b(\Sigma)$, all $\bar{\chi} \in \text{SEN}^b(\Sigma')$ and all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$:*

- (1) $\phi \triangleright_\Sigma \phi \in \text{Thm}_\Sigma(\mathfrak{G});$
- (2) $\phi \triangleright_\Sigma \chi \in G_\Sigma(\phi \triangleright_\Sigma \psi, \psi \triangleright_\Sigma \chi);$

- (3) $\sigma_\Sigma(\psi, \vec{\chi}) \triangleright_\Sigma \sigma'_\Sigma(\psi, \vec{\chi}) \in G_\Sigma(\phi \triangleright_\Sigma \psi, \psi \triangleright_\Sigma \phi, \sigma_\Sigma(\phi, \vec{\chi}) \triangleright_\Sigma \sigma'_\Sigma(\phi, \vec{\chi}));$
 (4) $G_\Sigma(\phi) = G_\Sigma(\rho_\Sigma^0[\tau_\Sigma[\phi]]).$

Proof: Directly by Theorem 1965. ■

26.9 Truth Equationality

By Theorem 1938, the closure system G of a Gentzen π -institution $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ can be recovered by the class $\text{MatFam}^{\text{Su}}(\mathfrak{G})$ of its Suszko reduced matrix families. A related issue is to investigate when G can be recovered just from the class of underlying $\mathbf{F}$ -algebraic systems of the class $\text{MatFam}^{\text{Su}}(\mathfrak{G})$, i.e., from the class $\text{AlgSys}(\mathfrak{G})$. The algebraizability property of $\mathfrak{G}$ gives that

$$\text{MatFam}^{\text{Su}}(\mathfrak{G}) = \{ \langle \mathcal{A}, \tau^{\mathcal{A}*}(\Delta^{\mathcal{A}}) : \mathcal{A} \in \text{AlgSys}(\mathfrak{G}) \},$$

where $\tau : \mathfrak{G} \rightarrow \mathfrak{G}^{\mathbf{K}}$ is the $\{\langle 1, 1 \rangle\}$ -tr-transformation witnessing the algebraizability. In this case, the $\mathbf{F}$ -algebraic system $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$ is the $\mathbf{F}$ -algebraic system reduct of a unique Suszko reduced $\mathfrak{G}$ -matrix family, i.e., the $\mathfrak{G}$ -filter family of every Suszko reduced $\mathfrak{G}$ -matrix family is uniquely determined by the $\mathbf{F}$ -algebraic system $\mathcal{A}$, since it is exactly $\tau^{\mathcal{A}*}(\Delta^{\mathcal{A}})$ and this expression does not depend on the choice of τ witnessing the algebraizability of $\mathfrak{G}$.

Even in the absence of algebraizability, however, if each $\mathbf{F}$ -algebraic system in $\text{AlgSys}(\mathfrak{G})$ is the $\mathbf{F}$ -algebraic system reduct of a unique Suszko reduced $\mathfrak{G}$ -matrix family, then, there exists, modulo a technical condition, analogous to the adequacy of the Suszko core introduced in a preceding chapter, a $\{\langle 1, 1 \rangle\}$ -tr-transformation τ that determines the unique $\mathfrak{G}$ -matrix filter on the $\mathbf{F}$ -algebraic system, as described previously.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution os trace tr based on $\mathbf{F}$.

- $\mathfrak{G}$ is **completely reflective**, or **c-reflective** for short, if, for all $\mathcal{T} \cup \{\mathcal{T}'\} \subseteq \text{ThFam}(\mathfrak{G})$,

$$\bigcap_{T \in \mathcal{T}} \Omega^{\mathcal{A}}(T) \leq \Omega^{\mathcal{A}}(T') \quad \text{implies} \quad \bigcap \mathcal{T} \leq T';$$

- $\mathfrak{G}$ is **truth equational** if there exists $\tau = \{\tau^{(m,n)} : \langle m, n \rangle \in \text{tr}\}$, where $\tau^{(m,n)} : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$, with $m + n$ distinguished arguments, such that, for all $T \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\phi \in T_\Sigma \quad \text{iff} \quad \tau_\Sigma^{(m,n)}[\phi] \subseteq \Omega_\Sigma(T).$$

First, we provide a characterization of c-reflectivity.

Theorem 1969 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution os trace tr based on $\mathbf{F}$. Then, the following statements are equivalent:*

- (i) *For every $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$, there exists unique $\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$;*
- (ii) *For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, and all $\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$, $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ is the least $\mathfrak{G}$ -filter family on $\mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$;*
- (iii) *For every $\mathbf{F}$ -algebraic system $\mathcal{A}$, $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}$ is injective on $\text{FiFam}^\mathfrak{G}(\mathcal{A})$;*
- (iv) *For every $\mathbf{F}$ -algebraic system $\mathcal{A}$ and all $\mathcal{T} \cup \{\mathbf{T}'\} \subseteq \text{FiFam}^\mathfrak{G}(\mathcal{A})$,*

$$\bigcap_{\mathbf{T} \in \mathcal{T}} \Omega^{\mathcal{A}}(\mathbf{T}) \leq \Omega^{\mathcal{A}}(\mathbf{T}') \quad \text{implies} \quad \bigcap \mathcal{T} \leq \mathbf{T}';$$

- (v) *For all $\mathcal{T} \cup \{\mathbf{T}'\} \subseteq \text{ThFam}(\mathfrak{G})$, $\bigcap_{\mathbf{T} \in \mathcal{T}} \Omega(\mathbf{T}) \leq \Omega(\mathbf{T}')$ implies $\bigcap \mathcal{T} \leq \mathbf{T}'$.*

Proof:

- (i) $\Rightarrow$ (ii) Suppose (i) holds and let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system and $\mathbf{T} \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$. Consider the algebraic system $\mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ and let $\mathbf{T}'$ be the least filter on $\mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$. Then, since $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) \in \text{FiFam}^\mathfrak{G}(\mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}))$, we get that $\mathbf{T}' \leq \mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$. Thus, by the monotonicity of the Suszko operator,

$$\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})}(\mathbf{T}') \leq \tilde{\Omega}^{\mathfrak{G}, \mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})}(\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})) = \Delta^{\mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})}.$$

But, noting that $\mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) \in \text{AlgSys}(\mathfrak{G})$, we get, by hypothesis, that $\mathbf{T}' = \mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$. Therefore, $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ is the least $\mathfrak{G}$ -filter family on $\mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$.

- (ii) $\Rightarrow$ (iii) Suppose that (ii) holds and let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system and $\mathbf{T}, \mathbf{T}' \in \text{FiFam}^\mathfrak{G}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) = \tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}')$. Then $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ is compatible with both $\mathbf{T}$ and $\mathbf{T}'$ and, hence, $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ and $\mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ are both $\mathfrak{G}$ -filter families on $\mathcal{A}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$. Thus, by hypothesis, $\mathbf{T}/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) \leq \mathbf{T}'/\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$. Therefore, taking into account the compatibility of $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T})$ with both $\mathbf{T}$ and $\mathbf{T}'$, we get $\mathbf{T} \leq \mathbf{T}'$. By symmetry, we also have $\mathbf{T}' \leq \mathbf{T}$, whence $\mathbf{T} = \mathbf{T}'$. Thus, $\tilde{\Omega}^{\mathfrak{G}, \mathcal{A}}$ is injective on $\text{FiFam}^\mathfrak{G}(\mathcal{A})$.

- (iii) $\Rightarrow$ (iv) Suppose (iii) holds and let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system and $\mathcal{T} \cup \{\mathbf{T}'\} \subseteq \text{FiFam}^\mathfrak{G}(\mathcal{A})$, such that

$$\bigcap_{\mathbf{T} \in \mathcal{T}} \Omega^{\mathcal{A}}(\mathbf{T}) \leq \Omega^{\mathcal{A}}(\mathbf{T}').$$

Then, we have

$$\begin{aligned}\tilde{\Omega}^{\mathfrak{G},\mathcal{A}}(\cap \mathcal{T} \cap \mathbf{T}') &= \cap \{\Omega^{\mathcal{A}}(\mathbf{X}) : \mathcal{T} \cap \mathbf{T}' \leq \mathbf{X} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})\} \\ &= \cap \{\Omega^{\mathcal{A}}(\mathbf{X}) : \cap \mathcal{T} \leq \mathbf{X} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})\} \\ &= \tilde{\Omega}^{\mathfrak{G},\mathcal{A}}(\cap \mathcal{T}).\end{aligned}$$

By hypothesis, we get $\cap \mathcal{T} \cap \mathbf{T}' = \cap \mathcal{T}$, whence $\cap \mathcal{T} \leq \mathbf{T}'$.

(iv) $\Rightarrow$ (v) Condition (v) is a special case of Condition (iv).

(v) $\Rightarrow$ (i) Assume that (v) holds and let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle \in \text{AlgSys}(\mathfrak{G})$ and $\mathbf{T}, \mathbf{T}' \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$, such that $\tilde{\Omega}^{\mathfrak{G},\mathcal{A}}(\mathbf{T}) = \tilde{\Omega}^{\mathfrak{G},\mathcal{A}}(\mathbf{T}') = \Delta^{\mathcal{A}}$. By Lemma 1928, $\alpha^{-1}(\mathbf{T})$ and $\alpha^{-1}(\mathbf{T}')$ are both theory families of $\mathfrak{G}$. Now we have, by hypothesis, $\tilde{\Omega}^{\mathfrak{G},\mathcal{A}}(\mathbf{T}) = \tilde{\Omega}^{\mathfrak{G},\mathcal{A}}(\mathbf{T}')$, whence, by the definition of the Suszko operator,

$$\cap \{\Omega^{\mathcal{A}}(\mathbf{X}) : \mathbf{T} \leq \mathbf{X} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})\} \leq \Omega^{\mathcal{A}}(\mathbf{T}').$$

Hence, applying α^{-1} to both sides,

$$\alpha^{-1}(\cap \{\Omega^{\mathcal{A}}(\mathbf{X}) : \mathbf{T} \leq \mathbf{X} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})\}) \leq \alpha^{-1}(\Omega^{\mathcal{A}}(\mathbf{T}')).$$

Equivalently,

$$\cap \{\alpha^{-1}(\Omega^{\mathcal{A}}(\mathbf{X})) : \mathbf{T} \leq \mathbf{X} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})\} \leq \alpha^{-1}(\Omega^{\mathcal{A}}(\mathbf{T}')).$$

By Lemma 1946,

$$\cap \{\Omega(\alpha^{-1}(\mathbf{X})) : \mathbf{T} \leq \mathbf{X} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})\} \leq \Omega(\alpha^{-1}(\mathbf{T}')).$$

By Condition (v),

$$\cap \{\alpha^{-1}(\mathbf{X}) : \mathbf{T} \leq \mathbf{X} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})\} \leq \alpha^{-1}(\mathbf{T}').$$

Hence, $\alpha^{-1}(\mathbf{T}) \leq \alpha^{-1}(\mathbf{T}')$, which gives, by the surjectivity of $\langle F, \alpha \rangle$, $\mathbf{T} \leq \mathbf{T}'$. By symmetry, we get that $\mathbf{T} = \mathbf{T}'$ and, therefore, there exists only one $\mathfrak{G}$ -filter family $\mathbf{T}$ on $\mathcal{A}$, such that $\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$. ■

It also turns out that a sufficient condition for the c-reflectivity of a Gentzen π -institution $\mathfrak{G}$ is the injectivity of the Suszko operator on all $\mathbf{F}$ -algebraic systems in $\text{AlgSys}(\mathfrak{G})$.

Lemma 1970 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If, for all $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$, $\tilde{\Omega}^{\mathfrak{G},\mathcal{A}}$ is injective on $\text{FiFam}^{\mathfrak{G}}(\mathcal{A})$, then $\mathfrak{G}$ is c-reflective.*

Proof: By the hypothesis, for all $\mathcal{A} \in \text{AlgSys}(\mathfrak{G})$, there exists a unique $\mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$, such that $\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$. Therefore, by Theorem 1969, $\mathfrak{G}$ is c-reflective. ■

Next we provide an alternative characterization of truth equationality, forming an analog of Theorem 819.

Theorem 1971 *Let $\mathbf{F} = \langle \text{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is truth equational if and only if, there exists $\tau = \{\tau^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$, where $\tau^{\langle m, n \rangle} : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^2$, with $m + n$ distinguished arguments, such that, for all $\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$, $\mathbf{T} = \tau^{\mathcal{A}*}(\Delta^{\mathcal{A}})$.*

Proof: Suppose $\mathfrak{G}$ is truth equational, with witnessing transformations $\tau = \{\tau^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$. Let $\langle \mathcal{A}, \mathbf{T} \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$, $\Sigma \in |\text{Sign}^b|$ and $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$. Then we have

$$\begin{aligned} \alpha_{\Sigma}(\phi) \in \mathbf{T}_{F(\Sigma)} & \text{ iff } \alpha_{\Sigma}(\phi) \in \mathbf{T}'_{F(\Sigma)}, \text{ all } \mathbf{T} \leq \mathbf{T}' \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \\ & \text{ iff } \phi \in \alpha_{\Sigma}^{-1}(\mathbf{T}'_{F(\Sigma)}), \text{ all } \mathbf{T} \leq \mathbf{T}' \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \\ & \text{ iff } \tau_{\Sigma}^{\langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\alpha^{-1}(\mathbf{T}')), \text{ all } \mathbf{T} \leq \mathbf{T}' \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \\ & \text{ iff } \tau_{\Sigma}^{\langle m, n \rangle}[\phi] \subseteq \alpha_{\Sigma}^{-1}(\Omega_{F(\Sigma)}^{\mathcal{A}}(\mathbf{T}')), \text{ all } \mathbf{T} \leq \mathbf{T}' \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \\ & \text{ iff } \alpha_{\Sigma}(\tau_{\Sigma}^{\langle m, n \rangle}[\phi]) \subseteq \Omega_{F(\Sigma)}^{\mathcal{A}}(\mathbf{T}'), \text{ all } \mathbf{T} \leq \mathbf{T}' \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A}) \\ & \text{ iff } \tau_{F(\Sigma)}^{\mathcal{A}, \langle m, n \rangle}[\alpha_{\Sigma}(\phi)] \subseteq \widetilde{\Omega}_{F(\Sigma)}^{\mathfrak{G}, \mathcal{A}}(\mathbf{T}) \\ & \text{ iff } \tau_{F(\Sigma)}^{\mathcal{A}, \langle m, n \rangle}[\alpha_{\Sigma}(\phi)] \subseteq \Delta_{F(\Sigma)}^{\mathcal{A}}. \end{aligned}$$

The conclusion follows by taking into account the surjectivity of $\langle F, \alpha \rangle$.

Conversely, assume that the condition in the statement holds and let $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\text{Sign}^b|$ and $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$. Then, since

$$\widetilde{\Omega}^{\mathfrak{G}, \mathcal{F}/\Omega(\mathbf{T})}(\mathbf{T}/\Omega(\mathbf{T})) \leq \Omega^{\mathcal{F}/\Omega(\mathbf{T})}(\mathbf{T}/\Omega * \mathbf{T}) = \Delta^{\mathcal{F}/\Omega(\mathbf{T})},$$

we get that $\langle \mathcal{F}/\Omega(\mathbf{T}), \mathbf{T}/\Omega(\mathbf{T}) \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$. Therefore, by hypothesis,

$$\phi/\Omega_{\Sigma}(\mathbf{T}) \in \mathbf{T}_{\Sigma}/\Omega_{\Sigma}(\mathbf{T}) \quad \text{iff} \quad \tau_{\Sigma}^{\mathcal{F}/\Omega(\mathbf{T}), \langle m, n \rangle}[\phi/\Omega_{\Sigma}(\mathbf{T})] \subseteq \Delta_{\Sigma}^{\mathcal{F}/\Omega(\mathbf{T})},$$

i.e.,

$$\phi/\Omega_{\Sigma}(\mathbf{T}) \in \mathbf{T}_{\Sigma}/\Omega_{\Sigma}(\mathbf{T}) \quad \text{iff} \quad \tau_{\Sigma}^{\langle m, n \rangle}[\phi]/\Omega_{\Sigma}(\mathbf{T}) \subseteq \Delta_{\Sigma}^{\mathcal{F}/\Omega(\mathbf{T})}.$$

By the compatibility of $\Omega(\mathbf{T})$ with $\mathbf{T}$, we now get

$$\phi \in \mathbf{T}_{\Sigma} \quad \text{iff} \quad \tau_{\Sigma}^{\langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\mathbf{T}).$$

Therefore, $\mathfrak{G}$ is truth equational. ■

Before turning into a characterization of the exact relationship between c-reflectivity and truth equationality, we prove that both c-reflectivity and truth equationality are preserved under equivalence of Gentzen π -institutions.

Theorem 1972 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr , tr' , respectively, based on $\mathbf{F}$. If $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent, then $\mathfrak{G}$ is c-reflective if and only if $\mathfrak{G}'$ is also.*

Proof: Suppose that $\mathfrak{G}'$ is c-reflective and let $\mathcal{T} \cup \{\mathbf{T}'\} \subseteq \text{ThFam}(\mathfrak{G})$, such that $\bigcap_{\mathbf{T} \in \mathcal{T}} \Omega(\mathbf{T}) \leq \Omega(\mathbf{T}')$. Then, by Proposition 1934, $\bigcap_{\mathbf{T} \in \mathcal{T}} \Omega(\rho^*(\mathbf{T})) \leq \Omega(\rho^*(\mathbf{T}'))$. Thus, by Theorem 1917 and the hypothesis, we get $\bigcap_{\mathbf{T} \in \mathcal{T}} \rho^*(\mathbf{T}) \leq \rho^*(\mathbf{T}')$ and, then, $\rho^*(\bigcap \mathcal{T}) \leq \rho^*(\mathbf{T}')$. As ρ^* is order reflecting, we conclude that $\bigcap \mathcal{T} \leq \mathbf{T}'$ and, therefore, $\mathfrak{G}$ is c-reflective. The converse follows by the symmetry of the notion of equivalence. ■

Theorem 1973 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr , tr' traces and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$, $\mathfrak{G}' = \langle \mathbf{F}, G' \rangle$ Gentzen π -institutions of traces tr , tr' , respectively, based on $\mathbf{F}$. If $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent, then $\mathfrak{G}$ is truth equational if and only if $\mathfrak{G}'$ is also.*

Proof: Suppose that $\mathfrak{G}$ and $\mathfrak{G}'$ are equivalent via a conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}'$ and that $\mathfrak{G}'$ is truth equational, with witnessing transformations $\sigma := \{\sigma^{(m,n)} : \langle m, n \rangle \in \text{tr}'\}$. Then, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle \in \text{tr}$, we get, setting, according to Theorem 1917, $\mathbf{T}' \in \text{ThFam}(\mathfrak{G}')$ be such that $\mathbf{T} \xrightarrow[\tau^*]{\rho^*} \mathbf{T}'$,

$$\begin{aligned} \phi \in \mathbf{T}_{\Sigma} & \text{ iff } \phi \in \tau_{\Sigma}^*(\mathbf{T}') && \text{(definition of } \mathbf{T}') \\ & \text{ iff } \tau_{\Sigma}[\phi] \subseteq \mathbf{T}'_{\Sigma} && \text{(definition of } \tau^*) \\ & \text{ iff } \sigma_{\Sigma}[\tau_{\Sigma}[\phi]] \subseteq \Omega_{\Sigma}(\mathbf{T}') && \text{(hypothesis)} \\ & \text{ iff } \sigma_{\Sigma}[\tau_{\Sigma}[\phi]] \subseteq \Omega_{\Sigma}(\rho^*(\mathbf{T})) && \text{(definition of } \mathbf{T}^*) \\ & \text{ iff } \sigma_{\Sigma}[\tau_{\Sigma}[\phi]] \subseteq \Omega_{\Sigma}(\mathbf{T}). && \text{(Proposition 1934)} \end{aligned}$$

Therefore, $\sigma \circ \tau$ witnesses the truth equationality of $\mathfrak{G}$. The converse follows by the symmetry of equivalence. ■

We now turn to the investigation of the exact relationship between complete reflectivity and truth equationality. We will show that for a Gentzen π -institution to be truth equational, it must be c-reflective and, in addition satisfy a technical condition analogous to the adequacy of the Suszko core in the context of π -institutions, that ensures that there are enough natural transformations in its category of natural transformations to specify the Suszko operator in a precise sense.

We start by showing that truth equationality implies c-reflectivity.

Proposition 1974 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. if $\mathfrak{G}$ is truth equational, then it is c-reflective.*

Proof: Suppose $\mathfrak{G}$ is truth equational, with witnessing transformations $\tau = \{\tau^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$, and let $\mathcal{T} \cup \{\mathbf{T}'\} \subseteq \text{ThFam}(\mathfrak{G})$, such that $\bigcap_{\mathbf{T} \in \mathcal{T}} \Omega(\mathbf{T}) \leq \Omega(\mathbf{T}')$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$, we have

$$\begin{aligned} \phi \in \bigcap_{\mathbf{T} \in \mathcal{T}} \mathbf{T}_{\Sigma} & \quad \text{iff} \quad \phi \in \mathbf{T}_{\Sigma}, \mathbf{T} \in \mathcal{T}, \\ & \quad \text{iff} \quad \tau_{\Sigma}^{\langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\mathbf{T}), \mathbf{T} \in \mathcal{T}, \\ & \quad \text{iff} \quad \tau_{\Sigma}^{\langle m, n \rangle}[\phi] \subseteq \bigcap_{\mathbf{T} \in \mathcal{T}} \Omega_{\Sigma}(\mathbf{T}) \\ & \quad \text{implies} \quad \tau_{\Sigma}^{\langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\mathbf{T}') \\ & \quad \text{iff} \quad \phi \in \mathbf{T}'_{\Sigma}. \end{aligned}$$

Thus, $\bigcap \mathcal{T} \leq \mathbf{T}'$ and, hence, $\mathfrak{G}$ is c-reflective. $\blacksquare$

The property of c-reflectivity also has a characterization involving both the Suszko and the Leibniz operator. Namely, we obtain

Lemma 1975 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is c-reflective if and only if, for all $\mathbf{T}, \mathbf{T}' \in \text{ThFam}(\mathfrak{G})$,*

$$\widetilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \leq \Omega(\mathbf{T}') \quad \text{implies} \quad \mathbf{T} \leq \mathbf{T}'.$$

Proof: Suppose, first, that $\mathfrak{G}$ is c-reflective and let $\mathbf{T}, \mathbf{T}' \in \text{ThFam}(\mathfrak{G})$, such that $\widetilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \leq \Omega(\mathbf{T}')$. Then, we get

$$\bigcap \{\Omega(\mathbf{X}) : \mathbf{T} \leq \mathbf{X} \in \text{ThFam}(\mathfrak{G})\} \leq \Omega(\mathbf{T}').$$

Hence, by hypothesis, $\bigcap \{\mathbf{X} : \mathbf{T} \leq \mathbf{X} \in \text{ThFam}(\mathfrak{G})\} \leq \mathbf{T}'$, i.e., $\mathbf{T} \leq \mathbf{T}'$.

Assume, conversely, that the condition of the statement holds and let $\mathcal{T} \cup \{\mathbf{T}'\} \subseteq \text{ThFam}(\mathfrak{G})$, such that $\bigcap_{\mathbf{T} \in \mathcal{T}} \Omega(\mathbf{T}) \leq \Omega(\mathbf{T}')$. Then we get

$$\widetilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\bigcap \mathcal{T}) \leq \bigcap \{\Omega(\mathbf{T}) : \mathbf{T} \in \mathcal{T}\} \leq \Omega(\mathbf{T}').$$

Thus, by hypothesis, $\bigcap \mathcal{T} \leq \mathbf{T}'$ and $\mathfrak{G}$ is c-reflective. $\blacksquare$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. Define the **Suszko core**

$$S^{\mathfrak{G}} = \{S^{\mathfrak{G}, \langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$$

of $\mathfrak{G}$, by setting, for all $\langle m, n \rangle \in \text{tr}$,

$$\begin{aligned} S^{\mathfrak{G}, \langle m, n \rangle} = \{ \sigma : (\text{SEN}^b)^{\omega} \rightarrow (\text{SEN}^b)^2 \in N^b : \\ (\forall \Sigma \in |\mathbf{Sign}^b|)(\forall \phi \in \text{Seq}_{\Sigma}^{\{\langle m, n \rangle\}}(\mathbf{F})) \\ (\sigma_{\Sigma}[\phi] \subseteq \widetilde{\Omega}_{\Sigma}^{\mathfrak{G}, \mathcal{F}}(G(\phi))) \}. \end{aligned}$$

$S^{\mathfrak{G}}$ is a set of natural candidates from which to seek witnesses for the truth equationality of $\mathfrak{G}$, if such exist, since it satisfies the following property.

Lemma 1976 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is truth equational, with witnessing transformations τ , then $\tau \subseteq S^\mathfrak{G}$.*

Proof: Suppose $\mathfrak{G}$ is truth equational, with witnessing transformations $\tau = \{\tau^{\langle m, n \rangle} : \langle m, n \rangle \in \text{tr}\}$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$, we have $\phi \in G_\Sigma(\phi)$, whence, $\phi \in \mathbf{T}_\Sigma$, for all $G(\phi) \leq \mathbf{T} \in \text{ThFam}(\mathfrak{G})$. Thus, by truth equationality, $\tau_\Sigma^{\langle m, n \rangle}[\phi] \subseteq \Omega_\Sigma(\mathbf{T})$ and, therefore, $\tau_\Sigma^{\langle m, n \rangle}[\phi] \subseteq \tilde{\Omega}_\Sigma^{\mathfrak{G}, \mathcal{F}}(G(\phi))$. We conclude that $\tau^{\langle m, n \rangle} \subseteq S^{\mathfrak{G}, \langle m, n \rangle}$. ■

The Suszko core of $\mathfrak{G}$ always carries a theory family $\mathbf{T}$ of $\mathfrak{G}$ into the Leibniz congruence system $\Omega(\mathbf{T})$ of the theory family $\mathbf{T}$.

Proposition 1977 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. For all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \mathbf{T}_\Sigma$ of trace $\langle m, n \rangle \in \text{tr}$,*

$$S_\Sigma^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_\Sigma(\mathbf{T}).$$

Proof: Let $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \mathbf{T}_\Sigma$ of trace $\langle m, n \rangle \in \text{tr}$. Then, by the definition of $S^\mathfrak{G}$, we get

$$S_\Sigma^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \tilde{\Omega}_\Sigma^{\mathfrak{G}, \mathcal{F}}(G(\phi)) \subseteq \tilde{\Omega}_\Sigma^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \subseteq \Omega_\Sigma(\mathbf{T}).$$

This establishes the conclusion. ■

The converse property, which does not always hold, is called *solubility of the Suszko core*.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $S^\mathfrak{G}$ is **soluble** if, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle \in \text{tr}$, we get

$$S_\Sigma^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_\Sigma(\mathbf{T}) \quad \text{implies} \quad \phi \in \mathbf{T}_\Sigma.$$

Truth equationality of a Gentzen π -institution guarantees the solubility of its Suszko core.

Theorem 1978 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is truth equational, then the Suszko core $S^\mathfrak{G}$ is soluble.*

Proof: Suppose that $\mathfrak{G}$ is truth equational, with witnessing transformations τ , and let $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$, such that $S_\Sigma^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_\Sigma(\mathbf{T})$. Then, by Lemma 1976, $\tau_\Sigma^{\langle m, n \rangle}[\phi] \subseteq \Omega_\Sigma(\mathbf{T})$. By truth equationality, $\phi \in \mathbf{T}_\Sigma$. Therefore, $S^\mathfrak{G}$ is indeed soluble. ■

Conversely, if the Suszko core of a given Gentzen π -institution $\mathfrak{G}$ is soluble, then it acts as a set of witnessing transformations for the truth equationality of $\mathfrak{G}$.

Theorem 1979 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $S^\mathfrak{G}$ is soluble, then $\mathfrak{G}$ is truth equational, with witnessing transformations $S^\mathfrak{G}$.*

Proof: We must show that, for all $T \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\phi \in T_\Sigma \quad \text{iff} \quad S_\Sigma^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_\Sigma(T).$$

The left to right implication is by Proposition 1977, whereas the reverse is by the hypothesis of the solubility of the Suszko core. ■

Theorems 1978 and 1979 allow two characterizations of truth equationality in terms of the solubility of the Suszko core and in terms of the definability of theory families by the Suszko core.

$$\mathfrak{G} \text{ is Truth Equational} \longleftrightarrow S^\mathfrak{G} \text{ is Soluble.}$$

Theorem 1980 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is truth equational if and only if its Suszko core $S^\mathfrak{G}$ is soluble.*

Proof: The “only if” by Theorem 1978. The “if” by Theorem 1979. ■

We say that $S^\mathfrak{G}$ **defines theory families** if, for all $T \in \text{ThFam}(\mathfrak{G})$ and all $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$,

$$\phi \in T_\Sigma \quad \text{iff} \quad S_\Sigma^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_\Sigma(T).$$

Then we can show

$$\mathfrak{G} \text{ is Truth Equational} \longleftrightarrow S^\mathfrak{G} \text{ Defines Theory Families.}$$

Theorem 1981 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is truth equational if and only if $S^\mathfrak{G}$ defines theory families.*

Proof: If $\mathfrak{G}$ is truth equational, then, by Theorem 1980, $S^\mathfrak{G}$ is soluble, whence it defines theory families. On the other hand, if $S^\mathfrak{G}$ defines theory families, then it is soluble and, hence, by Theorem 1980, $\mathfrak{G}$ is truth equational. ■

We now know that truth equationality of a Gentzen π -institution is equivalent to the solubility property of its Suszko core. The solubility property implies another property, which, in accordance with our previous work on π -institutions, we call adequacy. It says, roughly speaking, that in a Gentzen π -institution the category of natural transformations is rich enough to determine Suszko congruence systems in terms of the Leibniz congruence systems that it selects by inclusion. This property arises in a natural way by considering the following result relating the Suszko core with both Suszko and Leibniz congruence systems of theory families generated by single sequents.

Proposition 1982 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. For all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,*

$$\bigcap \{ \Omega(\mathbf{T}) : S_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\mathbf{T}) \} \leq \tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(G(\phi)).$$

Proof: Note that, for all $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$, we have

$$\begin{aligned} \phi \in \mathbf{T}_{\Sigma} &\Rightarrow S_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \tilde{\Omega}_{\Sigma}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \quad (\text{Suszko core}) \\ &\Rightarrow S_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\mathbf{T}). \quad (\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \leq \Omega(\mathbf{T})) \end{aligned}$$

Therefore, we get

$$\begin{aligned} \bigcap \{ \Omega(\mathbf{T}) : S_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\mathbf{T}) \} &\leq \bigcap \{ \Omega(\mathbf{T}) : S_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \tilde{\Omega}_{\Sigma}^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \} \\ &\leq \bigcap \{ \Omega(\mathbf{T}) : \phi \in \mathbf{T}_{\Sigma} \} \\ &= \tilde{\Omega}(G(\phi)). \end{aligned}$$

Thus, the displayed inclusion always holds. $\blacksquare$

The reverse inclusion is not always guaranteed, but, when it holds, we say that the Suszko core of $\mathfrak{G}$ is adequate. As the name suggests, the property somehow conveys the idea that $S^{\mathfrak{G}}[\phi]$ suffices to determine the theory families whose Leibniz congruence systems form a covering of the Suszko congruence system corresponding to the theory family $G(\phi)$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. The Suszko core $S^{\mathfrak{G}}$ is **adequate** if, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\tilde{\Omega}_{\Sigma}^{\mathfrak{G}, \mathcal{F}}(G(\phi)) \leq \bigcap \{ \Omega(\mathbf{T}) : S_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\mathbf{T}) \}.$$

We can prove immediately that solubility implies adequacy.

Proposition 1983 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If the Suszko core $S^{\mathfrak{G}}$ is soluble, then it is adequate.*

Proof: Suppose $S^{\mathfrak{G}}$ is soluble. We have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\begin{aligned} \tilde{\Omega}^{\mathfrak{G}, \mathcal{F}}(G(\phi)) &= \bigcap \{ \Omega(\mathbf{T}) : \phi \in \mathbf{T}_{\Sigma} \} \\ &\quad (\text{Suszko congruence system}) \\ &= \bigcap \{ \Omega(\mathbf{T}) : S_{\Sigma}^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\mathbf{T}) \}. \\ &\quad (\text{solubility of } S^{\mathfrak{G}}) \end{aligned}$$

Hence, the Suszko core of $\mathfrak{G}$ is adequate. $\blacksquare$

Conversely, if a Gentzen π -institution is c-reflective, then the adequacy of its Suszko core is sufficient to give its solubility.

Proposition 1984 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is c -reflective and the Suszko core $S^\mathfrak{G}$ is adequate, then $S^\mathfrak{G}$ is soluble.*

Proof: Assume $\mathfrak{G}$ is c -reflective and $S^\mathfrak{G}$ is adequate. Let $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$.

If $\phi \in \mathbf{T}_\Sigma$, then, by the definition of the Suszko core, we get

$$S_\Sigma^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \tilde{\Omega}_\Sigma^{\mathfrak{G}, \mathcal{F}}(G(\phi)) \subseteq \tilde{\Omega}_\Sigma^{\mathfrak{G}, \mathcal{F}}(\mathbf{T}) \subseteq \Omega_\Sigma(\mathbf{T}).$$

Assume conversely, that $S_\Sigma^{\mathfrak{G}, \langle m, n \rangle}[\phi] \subseteq \Omega_\Sigma(\mathbf{T})$. Then, by adequacy of the Suszko core, $\tilde{\Omega}^{\mathfrak{G}, \mathfrak{S}}(G(\phi)) \leq \Omega(\mathbf{T})$. Hence, by c -reflectivity and Lemma 1975, $G(\phi) \leq \mathbf{T}$, i.e., $\phi \in \mathbf{T}_\Sigma$. We conclude that $S^\mathfrak{G}$ is soluble. ■

We finally show that a Gentzen π -institution is truth equational if and only if it is c -reflective and has an adequate Suszko core.

$$\begin{aligned} \text{Truth Equationality} &= S^\mathfrak{G} \text{ Soluble} \\ &= S^\mathfrak{G} \text{ Defines Theory Families} \\ &= c\text{-Reflectivity} + S^\mathfrak{G} \text{ Adequate} \end{aligned}$$

Theorem 1985 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is truth equational if and only if it is c -reflective and has an adequate Suszko core.*

Proof: If $\mathfrak{G}$ is truth equational, then, by Proposition 1974, it is c -reflective, by Theorem 1978, its Suszko core is soluble and, by Proposition 1983, its Suszko core is adequate. On the other hand, if $\mathfrak{G}$ is c -reflective with an adequate Suszko core, then, by Proposition 1984, its Suszko core is soluble and, hence, by Theorem 1979, $\mathfrak{G}$ is truth equational. ■

We also obtain immediately

Corollary 1986 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a protoalgebraic Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is truth equational if and only if its Leibniz operator is injective on theory families and has an adequate Suszko core.*

Proof: If $\mathfrak{G}$ is truth equational, then, by Theorem 1985, it is c -reflective and has an adequate Suszko core, whence, it has, a fortiori, a Leibniz operator injective on theory families and an adequate Suszko core.

Conversely, by Theorem 1985, it suffices to show that monotonicity and injectivity of the Leibniz operator imply its c -reflectivity. In fact, given $\mathbf{T}, \mathbf{T}' \in \text{ThFam}(\mathfrak{G})$, we have

$$\begin{aligned} \tilde{\Omega}^{\mathfrak{G}, \mathcal{G}}(\mathbf{T}) \leq \Omega(\mathbf{T}') &\Rightarrow \Omega(\mathbf{T}) \leq \Omega(\mathbf{T}') \quad (\text{Protoalgebraicity}) \\ &\Rightarrow \Omega(\mathbf{T} \cap \mathbf{T}') = \Omega(\mathbf{T}) \cap \Omega(\mathbf{T}') = \Omega(\mathbf{T}) \\ &\quad (\text{Protoalgebraicity}) \\ &\Rightarrow \mathbf{T} \cap \mathbf{T}' = \mathbf{T} \quad (\text{Injectivity}) \\ &\Rightarrow \mathbf{T} \leq \mathbf{T}'. \end{aligned}$$

Thus, $\mathfrak{G}$ is c-reflective, by Lemma 1975. $\blacksquare$

We close the section by a result asserting that truth equationality transfers from a Gentzen π -institution $\mathfrak{G}$ to all $\mathfrak{G}$ -matrix families.

Theorem 1987 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is truth equational, with witnessing transformations $\tau = \{\tau^{(m,n)} : \langle m, n \rangle \in \text{tr}\}$ if and only if, for every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, and all $\mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}|$ and $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathcal{A})$ of trace $\langle m, n \rangle$,*

$$\phi \in \mathbf{T}_{\Sigma} \quad \text{iff} \quad \tau_{\Sigma}^{\mathcal{A}, \langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}^{\mathcal{A}}(\mathbf{T}).$$

Proof: Suppose $\mathfrak{G}$ is truth equational, with witnessing transformations $\tau = \{\tau^{(m,n)} : \langle m, n \rangle \in \text{tr}\}$ and let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system, $\mathbf{T} \in \text{FiFam}^{\mathfrak{G}}(\mathcal{A})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$. Then, we have

$$\begin{aligned} \alpha_{\Sigma}(\phi) \in \mathbf{T}_{F(\Sigma)} & \quad \text{iff} \quad \phi \in \alpha_{\Sigma}^{-1}(\mathbf{T}_{F(\Sigma)}) \\ & \quad \text{iff} \quad \tau_{\Sigma}^{\langle m, n \rangle}[\phi] \subseteq \Omega_{\Sigma}(\alpha^{-1}(\mathbf{T})) \\ & \quad \text{iff} \quad \tau_{\Sigma}^{\langle m, n \rangle}[\phi] \subseteq \alpha_{\Sigma}^{-1}(\Omega_{F(\Sigma)}^{\mathcal{A}}(\mathbf{T})) \\ & \quad \text{iff} \quad \alpha_{\Sigma}(\tau_{\Sigma}^{\langle m, n \rangle}[\phi]) \subseteq \Omega_{F(\Sigma)}^{\mathcal{A}}(\mathbf{T}) \\ & \quad \text{iff} \quad \tau_{F(\Sigma)}^{\mathcal{A}, \langle m, n \rangle}[\alpha_{\Sigma}(\phi)] \subseteq \Omega_{F(\Sigma)}^{\mathcal{A}}(\mathbf{T}). \end{aligned}$$

Taking into account the surjectivity of $\langle F, \alpha \rangle$, we have the conclusion. $\blacksquare$

26.10 Weak Algebraizability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is called **WF algebraizable** if it is protoalgebraic and c-reflective.

Proposition 1988 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. $\mathfrak{G}$ is WF algebraizable if and only if the Leibniz operator is monotone and injective on $\text{ThFam}(\mathfrak{G})$.*

Proof: It suffices to show that, under monotonicity, c-reflectivity and injectivity are equivalent properties. Indeed, c-reflectivity always implies injectivity because it implies order reflectivity. On the other hand, suppose that the Leibniz operator is monotone and injective. Then, we have, by monotonicity, for all $\mathcal{T} \cup \{\mathcal{T}'\} \subseteq \text{ThFam}(\mathfrak{G})$, such that $\bigcap_{\mathbf{T} \in \mathcal{T}} \Omega(\mathbf{T}) \leq \Omega(\mathbf{T}')$,

$$\Omega(\bigcap_{\mathbf{T} \in \mathcal{T}} \mathbf{T} \cap \mathbf{T}') = \bigcap_{\mathbf{T} \in \mathcal{T}} \Omega(\mathbf{T}) \cap \Omega(\mathbf{T}') = \bigcap_{\mathbf{T} \in \mathcal{T}} \Omega(\mathbf{T}) = \Omega(\bigcap \mathcal{T}).$$

Thus, by injectivity, $\bigcap \mathcal{T} \cap \mathbf{T}' = \bigcap \mathcal{T}$ and, hence, $\bigcap \mathcal{T} \leq \mathbf{T}'$. Therefore $\mathfrak{G}$ is also c-reflective. $\blacksquare$

The following theorem provides characterations of WF algebraizability.

Theorem 1989 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. Then the following statements are equivalent:*

- (i) $\mathfrak{G}$ is WF algebraizable;
- (ii) The Leibniz operator defines an order isomorphism from $\mathbf{ThFam}(\mathfrak{G})$ onto the lattice of all $\text{AlgSys}(\mathfrak{G})$ -congruence families on $\mathcal{F}$;
- (iii) For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, the Leibniz operator defines an order isomorphism from $\mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$ onto the lattice of all $\text{AlgSys}(\mathfrak{G})$ -congruence systems on $\mathcal{A}$;
- (iv) For every $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle \in \text{AlgSys}(\mathfrak{G})$, the Leibniz operator defines an order isomorphism from $\mathbf{FiFam}^\mathfrak{G}(\mathcal{A})$ onto the lattice of all $\text{AlgSys}(\mathfrak{G})$ -congruence systems on $\mathcal{A}$.

Proof:

- (i) $\Rightarrow$ (ii) Suppose $\mathfrak{G}$ is WF algebraizable. Denote $\text{ConSys}(\mathfrak{G})$ the collection of all $\text{AlgSys}(\mathfrak{G})$ -congruences on $\mathcal{F}$. Then, since, for all $\mathbf{T} \in \mathbf{ThFam}(\mathfrak{G})$,

$$\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}/\Omega(\mathbf{T})}(\mathbf{T}/\Omega(\mathbf{T})) \leq \Omega^{\mathcal{F}/\Omega(\mathbf{T})}(\mathbf{T}/\Omega(\mathbf{T})) = \Delta^{\mathcal{F}/\Omega(\mathbf{T})},$$

we get that $\langle \mathcal{F}/\Omega(\mathbf{T}), \mathbf{T}/\Omega(\mathbf{T}) \rangle \in \text{MatFam}^{\text{Su}}(\mathfrak{G})$. Thus, $\mathcal{F}/\Omega(\mathbf{T}) \in \text{AlgSys}(\mathfrak{G})$ and, therefore, $\Omega(\mathbf{T}) \in \text{ConSys}(\mathfrak{G})$. This shows that $\Omega : \mathbf{ThFam}(\mathfrak{G}) \rightarrow \text{ConSys}(\mathfrak{G})$ is well defined. By Proposition 1988, it is injective. To see that it is surjective, consider $\theta \in \text{ConSys}(\mathfrak{G})$. Then, by definition, $\mathcal{F}/\theta \in \text{AlgSys}(\mathfrak{G})$, i.e., there exists $\mathbf{T} \in \mathbf{FiFam}^\mathfrak{G}(\mathcal{F}/\theta)$, such that $\tilde{\Omega}^{\mathfrak{G}, \mathcal{F}/\theta}(\mathbf{T}) = \Delta^{\mathcal{F}/\theta}$. However, since the Leibniz operator is monotone, by hypothesis, we get that the Susko operator coincides with the Leibniz operator, whence $\Omega^{\mathcal{F}/\theta}(\mathbf{T}) = \Delta^{\mathcal{F}/\theta}$. Denoting by $\langle I, \pi \rangle : \mathcal{F} \rightarrow \mathcal{F}/\theta$ the quotient morphism, we now get

$$\Omega(\pi^{-1}(\mathbf{T})) = \pi^{-1}(\Omega^{\mathcal{F}/\theta}(\mathbf{T})) = \pi^{-1}(\Delta^{\mathcal{F}/\theta}) = \theta.$$

Thus, Ω is indeed surjective. It is monotone by hypothesis and it is order reflecting, since it is c-reflective. Thus, $\Omega : \mathbf{ThFam}(\mathfrak{G}) \rightarrow \mathbf{ConSys}(\mathfrak{G})$ is in fact an order isomorphism.

- (ii) $\Rightarrow$ (iii) It is not difficult to show that $\Omega^{\mathcal{A}}$ is also monotone and c-reflective. Therefore, one can work in the same way as in Part (ii) replacing the mapping Ω by $\Omega^{\mathcal{A}} : \mathbf{FiFam}^\mathfrak{G}(\mathcal{A}) \rightarrow \mathbf{ConSys}^\mathfrak{G}(\mathcal{A})$, where $\text{ConSys}^\mathfrak{G}(\mathcal{A})$ denotes the collection of $\text{AlgSys}(\mathfrak{G})$ -congruence systems on $\mathcal{A}$.
- (iii) $\Rightarrow$ (iv) Condition (iv) is a special case of Condition (iii).

- (iv) $\Rightarrow$ (i) If Condition (iv) holds, the $\mathfrak{G}$ is protoalgebraic, by Lemma 1948. Hence the Leibniz and Suszko operators coincide on the $\mathfrak{G}$ -filter families of all $\mathbf{F}$ -algebraic systems. Thus, by Theorem 1969, $\mathfrak{G}$ is also truth equational. Therefore, it is WF algebraizable. $\blacksquare$

Finally, based on results of preceding sections, we can also give a relation between algebraizability and WF algebraizability.

We show, first, that, if $\mathfrak{G}$ is algebraizable, then it is both syntactically protoalgebraic and truth equational.

We start by giving a modus ponens property in the case of algebraizability.

Lemma 1990 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is algebraizable via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$, for some class K of $\mathbf{F}$ -algebraic systems, then, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,*

$$\psi \in G_{\Sigma}(\{\phi\} \cup \bigcup_{i < m+n} \rho_{\Sigma}[\phi_i, \psi_i]).$$

Proof: We have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$,

$$\tau_{\Sigma}[\psi] \subseteq G_{\Sigma}^K(\tau_{\Sigma}[\phi] \cup \{\phi_i \triangleright_{\Sigma} \psi_i : i < m + n\}).$$

Thus, we get

$$\rho_{\Sigma}[\tau_{\Sigma}[\psi]] \subseteq G_{\Sigma}(\rho_{\Sigma}[\tau_{\Sigma}[\phi]] \cup \bigcup_{i < m+n} \rho_{\Sigma}[\phi_i, \psi_i]).$$

Therefore, $\psi \in G_{\Sigma}(\{\phi\} \cup \bigcup_{i < m+n} \rho_{\Sigma}[\phi_i, \psi_i])$. $\blacksquare$

Moreover, in case of algebraizability, the isomorphism ρ^* from the theory families of the Gentzen π -institution $\mathfrak{G}$ to the K -congruence systems on $\mathcal{F}$ coincides with the Leibniz operator Ω .

Proposition 1991 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \mathbf{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is algebraizable via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$, for some class K of $\mathbf{F}$ -algebraic systems, then, for all $T \in \text{ThFam}(\mathfrak{G})$,*

$$\rho^*(T) = \Omega(T).$$

Proof: Let $T \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \mathbf{SEN}^b(\Sigma)$.

If $\langle \phi, \psi \rangle \in \Omega_{\Sigma}(T)$, then, since $\Omega(T)$ is a congruence system, we get, for all $\sigma \in \rho$ and all $\vec{\chi} \in \mathbf{SEN}^b(\Sigma)$,

$$\langle \sigma_{\Sigma}(\phi, \phi, \vec{\chi}), \sigma_{\Sigma}(\phi, \psi, \vec{\chi}) \rangle \in \Omega_{\Sigma}(T).$$

But $\sigma_\Sigma(\phi, \phi, \bar{\chi}) \in \text{Thm}_\Sigma(\mathfrak{G}) \subseteq \mathbf{T}_\Sigma$. Therefore, by the compatibility of $\Omega(\mathbf{T})$ with $\mathbf{T}$, we get that $\sigma_\Sigma(\phi, \psi, \bar{\chi}) \in \mathbf{T}_\Sigma$. Therefore, $\rho_\Sigma[\phi, \psi] \subseteq \mathbf{T}_\Sigma$, which gives that $\langle \phi, \psi \rangle \in \rho_\Sigma^*(\mathbf{T})$.

Conversely, to see that $\rho^*(\mathbf{T}) \leq \Omega(\mathbf{T})$ it suffices, by the maximality property of $\Omega(\mathbf{T})$, to show that $\rho^*(\mathbf{T})$ is compatible with $\mathbf{T}$. Let $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$, such that $\langle \phi, \psi \rangle \in \rho_\Sigma^*(\mathbf{T})$ and $\phi \in \mathbf{T}_\Sigma$. Then, we have $\rho_\Sigma[\phi_i, \psi_i] \subseteq \mathbf{T}_\Sigma$, for all $i < m + n$, and $\phi \in \mathbf{T}_\Sigma$, whence, by Lemma 1990, $\psi \in \mathbf{T}_\Sigma$. We conclude that $\rho^*(\mathbf{T})$ is compatible with $\mathbf{T}$, giving $\rho^*(\mathbf{T}) \leq \Omega(\mathbf{T})$. ■

Now, we prove one of the main theorems of the section to the effect that algebraizability implies both syntactic protoalgebraicity and truth equationality.

Theorem 1992 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is algebraizable via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$, for some class K of $\mathbf{F}$ -algebraic systems, then, $\mathfrak{G}$ is syntactically protoalgebraic and truth equational.*

Proof: Suppose $\mathfrak{G}$ is algebraizable via the conjugate pair $(\tau, \rho) : \mathfrak{G} \rightleftarrows \mathfrak{G}^K$, for some class K of $\mathbf{F}$ -algebraic systems.

Let, first, $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi, \psi \in \text{SEN}^b(\Sigma)$. Then we have

$$\begin{aligned} \langle \phi, \psi \rangle \in \Omega_\Sigma(\mathbf{T}) & \text{ iff } \langle \phi, \psi \rangle \in \rho_\Sigma^*(\mathbf{T}) \quad (\text{Proposition 1991}) \\ & \text{ iff } \rho_\Sigma[\phi, \psi] \subseteq \mathbf{T}_\Sigma. \quad (\text{definition of } \rho^*) \end{aligned}$$

Therefore, $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations ρ .

Finally, let $\mathbf{T} \in \text{ThFam}(\mathfrak{G})$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{Seq}_\Sigma^{\text{tr}}(\mathbf{F})$ of trace $\langle m, n \rangle$. Then, we have

$$\begin{aligned} \phi \in \mathbf{T}_\Sigma & \text{ iff } \rho_\Sigma[\tau_\Sigma[\phi]] \subseteq \mathbf{T}_\Sigma \quad ((\tau, \rho) \text{ conjugate pair}) \\ & \text{ iff } \tau_\Sigma[\phi] \subseteq \rho_\Sigma^*(\mathbf{T}) \quad (\text{definition of } \rho^*) \\ & \text{ iff } \tau_\Sigma[\phi] \subseteq \Omega_\Sigma(\mathbf{T}). \quad ((\text{Proposition 1991})) \end{aligned}$$

Therefore, $\mathfrak{G}$ is truth equational, with witnessing transformations τ . ■

We show, next, that, conversely, syntactic protoalgebraicity and truth equationality guarantee algebraizability.

Theorem 1993 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. If $\mathfrak{G}$ is syntactically protoalgebraic and truth equational, then it is algebraizable.*

Proof: Suppose that $\mathfrak{G}$ is syntactically protoalgebraic, with witnessing transformations ρ , and truth equational, with witnessing transformations τ . Then, we have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \text{Seq}_{\Sigma}^{\text{tr}}(\mathbf{F})$,

$$\begin{aligned} \phi \in G_{\Sigma}(\Phi) & \text{ iff } \phi \in \bigcap \{T_{\Sigma} : \Phi \subseteq T_{\Sigma}\} \\ & \text{ iff } \tau_{\Sigma}[\phi] \subseteq \bigcap \{\Omega_{\Sigma}(T) : \tau_{\Sigma}[\Phi] \subseteq \Omega_{\Sigma}(T)\} \\ & \text{ iff } \tau_{\Sigma}[\phi] \subseteq G_{\Sigma}^K(\tau_{\Sigma}[\Phi]). \end{aligned}$$

Moreover, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}^b(\Sigma)$,

$$\begin{aligned} \langle \phi, \psi \rangle \in \Omega_{\Sigma}(T) & \text{ iff } \rho_{\Sigma}[\phi, \psi] \subseteq T_{\Sigma} \\ & \text{ iff } \tau_{\Sigma}[\rho_{\Sigma}[\phi, \psi]] \subseteq \Omega_{\Sigma}(T). \end{aligned}$$

Hence, we have that $G_{\Sigma}^K(\phi \triangleright_{\Sigma} \psi) = G_{\Sigma}^K(\tau_{\Sigma}[\rho_{\Sigma}[\phi, \psi]])$.

We conclude, by Lemma 1916, that $\mathfrak{G}$ is equivalent to $\mathfrak{G}^K$ and, therefore, $\mathfrak{G}$ is algebraizable. $\blacksquare$

Now we can formulate the main characterization theorem:

Theorem 1994 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \text{SEN}^b, N^b \rangle$ be an algebraic system, tr a trace and $\mathfrak{G} = \langle \mathbf{F}, G \rangle$ a Gentzen π -institution of trace tr based on $\mathbf{F}$. The following statements are equivalent:*

- (i) $\mathfrak{G}$ is algebraizable;
- (ii) $\mathfrak{G}$ is syntactically protoalgebraic and truth equational;
- (iii) $\mathfrak{G}$ is WF algebraizable (i.e., protoalgebraic and c-reflective) and has both a Leibniz reflexive core and an adequate Suszko core.

Proof: If $\mathfrak{G}$ is algebraizable, then, by Theorem 1992, it is syntactically protoalgebraic and truth equational. If $\mathfrak{G}$ is syntactically protoalgebraic and truth equational, then, by Theorems 1961 and 1985, it is protoalgebraic, c-reflective and has both a Leibniz reflexive core and an adequate Suszko core. Finally, if $\mathfrak{G}$ is WF algebraizable, with a Leibniz reflexive core and an adequate Suszko core, then, by Theorems 1961 and 1985, it is syntactically protoalgebraic and truth equational, whence, by Theorem 1993, it is algebraizable. $\blacksquare$

Chapter 27

Behavioral Algebraizability

27.1 Behavioral π -Institutions

Let **Sign** be an arbitrary category of **signatures**, S a nonempty set of **sorts** and, for each $s \in S$,

$$\text{SEN}_s : \mathbf{Sign} \rightarrow \mathbf{Set}$$

a functor giving, for each signature Σ , a set of Σ -sentences **of sort** s . By a **multi-sorted sentence functor over set of sorts** S we understand the collection

$$\{\text{SEN}_s : s \in S\},$$

where all sets $\text{SEN}_s(\Sigma)$, $s \in S$, are assumed to be disjoint, i.e.,

$$\text{SEN}_s(\Sigma) \cap \text{SEN}_{s'}(\Sigma) = \emptyset, \text{ for all } s, s' \in S, s \neq s'.$$

Because of this condition, given $\Sigma, \Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and $\Phi \subseteq \bigcup_{s \in S} \text{SEN}_s(\Sigma)$, we write

$$\text{SEN}(f)(\Phi) = \bigcup_{s \in S} \{\text{SEN}_s(f)(\phi) : \phi \in \Phi \text{ of sort } s\}.$$

A multi-sorted sentence functor over set of sorts S is called **behavioral** if a nonempty subset $V \subseteq S$ of **formula sorts** has been singled out and, moreover, there exists a companion subset $V^* = \{v^* : v \in V\}$ of **visible sorts**. In that case the (perhaps empty) set $H = S - (V \cup V^*)$ is called the set of **hidden sorts**. To denote a behavioral functor, making the set of visible and set of hidden sorts explicit, we write

$$\{\text{SEN}_v, \text{SEN}_{v^*}, \text{SEN}_h : v \in V, h \in H\},$$

or sometimes, for the sake of succinctness,

$$\{\text{SEN}_s\}_H^{V, V^*}.$$

Let **Sign** be a category and $\{\text{SEN}_s\}_{s \in S}$ a multi-sorted sentence functor. The **clone of all natural transformations** on $\{\text{SEN}_s\}_{s \in S}$ is the locally small category with:

- objects $\prod_{\kappa < \alpha} \text{SEN}_{s_\kappa}$, with $s_\kappa \in S$, α an ordinal;
- morphisms $\tau : \prod_{\kappa < \alpha} \text{SEN}_{s_\kappa} \rightarrow \prod_{\lambda < \beta} \text{SEN}_{s'_\lambda}$ are β -sequences of natural transformations

$$\tau_\lambda : \prod_{\kappa < \alpha} \text{SEN}_{s_\kappa} \rightarrow \text{SEN}_{s'_\lambda}, \quad \lambda < \beta.$$

Composition is defined as ordinary composition, i.e., by setting

$$\prod_{\kappa < \alpha} \text{SEN}_{s_\kappa} \xrightarrow{\langle \tau_\lambda : \lambda < \beta \rangle} \prod_{\lambda < \beta} \text{SEN}_{s'_\lambda} \xrightarrow{\langle \sigma_\mu : \mu < \gamma \rangle} \prod_{\mu < \gamma} \text{SEN}_{s''_\mu}$$

$$\langle \sigma_\mu : \mu < \gamma \rangle \circ \langle \tau_\lambda : \lambda < \beta \rangle = \langle \sigma_\mu (\langle \tau_\lambda : \lambda < \beta \rangle) : \mu < \gamma \rangle.$$

A subcategory N of the clone of all natural transformations on $\{\text{SEN}_s\}_{s \in S}$, with objects all objects of the form $\prod_{i=1}^k \text{SEN}_{s_i}$, $k < \omega$, is called a **category of natural transformations on $\{\text{SEN}_s\}_{s \in S}$** if the following conditions hold:

- It contains all natural projections

$$p^{s_1 \cdots s_k \rightarrow s_i} : \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_{s_i}, i < k, k < \omega.$$

- For every collection $\{\tau_i : \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_{s'_i} : i < \ell\}$ of ℓ natural transformations in N , the tuple

$$\langle \tau_i : i < \ell \rangle : \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \prod_{j=1}^{\ell} \text{SEN}_{s'_j}$$

is also a natural transformation in N .

We refer to these conditions by saying that N “includes all projections” and is “closed under combinations” of natural transformations.

Let $\{\text{SEN}_s\}_H^{V, V^*}$ be a behavioral sentence functor. A subcategory N of the clone of all natural transformations on $\{\text{SEN}_s\}_{s \in S}$, with objects all objects of the form $\prod_{i=1}^k \text{SEN}_{s_i}$, $k < \omega$, is called a **category of natural transformations on $\{\text{SEN}_s\}_H^{V, V^*}$** if, in addition to being a category of natural transformations on $\{\text{SEN}_s\}_{s \in S}$, i.e., to including all projections and being closed under combinations, the following condition also holds:

- For all $v \in V$, there is no outgoing natural transformation from SEN_{v^*} , other than the identity, and there exists a unique surjective natural transformation

$$o_v : \text{SEN}_v \rightarrow \text{SEN}_{v^*},$$

called the **v -observation natural transformation**, or, simply, **observation**, when the formula sort v to which it corresponds is clear from context, such that, every incoming natural transformation $\sigma^* : \text{SEN}_s \rightarrow \text{SEN}_{v^*}$ factors through o_v :

$$\begin{array}{ccc} \text{SEN}_s & \xrightarrow{\sigma^*} & \text{SEN}_{v^*} \\ & \searrow \sigma & \nearrow o_v \\ & \text{SEN}_v & \end{array}$$

We express this condition by saying that N “has observations”.

Given a natural transformation $\sigma : \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_s$ in N , we call $s_1 \cdots s_k \rightarrow s$ the **type of σ** and say that σ is **of sort s** (i.e., of the output sort).

A **multi-sorted algebraic system** $\mathbf{F} = \langle \mathbf{Sign}, \{\text{SEN}_s\}_{s \in S}, N \rangle$ consists of a category of signatures, a multi-sorted sentence functor and a category N of natural transformations on $\{\text{SEN}_s\}_{s \in S}$. It is called **behavioral** if $\{\text{SEN}_s\}_H^{V, V^*}$ is a behavioral sentence functor and N is a category of natural transformations on $\{\text{SEN}_s\}_H^{V, V^*}$ (i.e., has observations), and we then write

$$\mathbf{F} = \langle \mathbf{Sign}, \{\text{SEN}_s\}_H^{V, V^*}, N \rangle.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_{s \in S}, N^b \rangle$ be a multi-sorted algebraic system. An N^b -**algebraic system** is a multi-sorted algebraic system

$$\mathbf{A} = \langle \mathbf{Sign}, \{\text{SEN}_s\}_{s \in S}, N \rangle,$$

such that there exists a surjective functor $F : N^b \rightarrow N$ that preserves all natural projections (and, hence, the type of all natural transformations in N^b). We use $\sigma^{\mathbf{A}}$ to refer to the image of σ in N^b under F .

Moreover, given two N -algebraic systems $\mathbf{A} = \langle \mathbf{Sign}, \{\text{SEN}_s\}_{s \in S}, N \rangle$ and $\mathbf{B} = \langle \mathbf{Sign}', \{\text{SEN}'_s\}_{s \in S}, N' \rangle$, a **morphism**

$$\langle F, \alpha \rangle : \mathbf{A} \rightarrow \mathbf{B}$$

consists of a functor $F : \mathbf{Sign} \rightarrow \mathbf{Sign}'$ and a collection $\alpha = \{\alpha^s\}_{s \in S}$ of natural transformations $\alpha^s : \text{SEN}_s \rightarrow \text{SEN}'_s \circ F$, $s \in S$, such that, for every $\sigma : \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_s^b$ in N , all $\Sigma \in |\mathbf{Sign}|$, and all $\phi_i \in \text{SEN}_{s_i}(\Sigma)$, $i \leq k$,

$$\alpha_\Sigma^s(\sigma_\Sigma^{\mathbf{A}}(\phi_1, \dots, \phi_k)) = \sigma_{F(\Sigma)}^{\mathbf{B}}(\alpha_\Sigma^{s_1}(\phi_1), \dots, \alpha_\Sigma^{s_k}(\phi_k)).$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_{s \in S}, N^b \rangle$ be a multi-sorted algebraic system. An **F-algebraic system** $\mathcal{A}$ is a pair $\langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, where

- $\mathbf{A} = \langle \mathbf{Sign}, \{\text{SEN}_s\}_{s \in S}, N \rangle$ is an N^b -algebraic system;
- $\langle F, \alpha \rangle : \mathbf{F} \rightarrow \mathbf{A}$ is a surjective morphism, i.e., such that $F : \mathbf{Sign} \rightarrow \mathbf{Sign}'$ is surjective and full and $\alpha_\Sigma^s : \text{SEN}_s^b(\Sigma) \rightarrow \text{SEN}_s(F(\Sigma))$ is surjective, for all $\Sigma \in |\mathbf{Sign}|$ and all $s \in S$.

Given two **F-algebraic systems** $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and $\mathcal{B} = \langle \mathbf{B}, \langle G, \beta \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \{\text{SEN}_s\}_{s \in S}, N \rangle$ and $\mathbf{B} = \langle \mathbf{Sign}', \{\text{SEN}'_s\}_{s \in S}, N' \rangle$, a **morphism**

$$\langle H, \gamma \rangle : \mathcal{A} \rightarrow \mathcal{B}$$

is a morphism $\langle H, \gamma \rangle : \mathbf{A} \rightarrow \mathbf{B}$, such that

$$\begin{array}{ccc} & \mathbf{F} & \\ \langle F, \alpha \rangle \swarrow & & \searrow \langle G, \beta \rangle \\ \mathbf{A} & \xrightarrow{\langle H, \gamma \rangle} & \mathbf{B} \end{array}$$

$$\langle H, \gamma \rangle \circ \langle F, \alpha \rangle = \langle G, \beta \rangle.$$

A **behavioral π -institution** is a pair $\mathcal{I} = \langle \mathbf{F}, C \rangle$, where

- $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_{s \in H}^{V, V^*}, N^b \rangle$ is a behavioral algebraic system;
- $C = \{C_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$ is a **closure system on** $\{\text{SEN}_v^b\}_{v \in V}$, i.e., for all $\Sigma \in |\mathbf{Sign}^b|$,

$$C_\Sigma : \mathcal{P}\left(\bigcup_{v \in V} \text{SEN}_v^b(\Sigma)\right) \rightarrow \mathcal{P}\left(\bigcup_{v \in V} \text{SEN}_v^b(\Sigma)\right)$$

is a closure operator and, for all $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\Phi \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)$,

$$\text{SEN}^b(f)(C_\Sigma(\Phi)) \subseteq C_{\Sigma'}(\text{SEN}^b(f)(\Phi)).$$

Given a behavioral algebraic system $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_{s \in H}^{V, V^*}, N^b \rangle$, a **behavioral sentence family** $T = \{T_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$ **of $\mathbf{F}$** consists of subsets

$$T_\Sigma \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma), \quad \Sigma \in |\mathbf{Sign}^b|.$$

Given a behavioral π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$, based on $\mathbf{F}$, a **behavioral theory family** $T = \{T_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$ **of $\mathcal{I}$** is a behavioral sentence family of $\mathbf{F}$, such that, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$C_\Sigma(T_\Sigma) = T_\Sigma.$$

We write $\text{ThFam}(\mathcal{I})$ for the collection of all behavioral theory families of $\mathcal{I}$.

27.2 Behavioral Algebra

Let $\mathbf{F} = \langle \mathbf{Sign}, \{\text{SEN}_s\}_{s \in S}, N \rangle$ be a multi-sorted algebraic system. An **equivalence family** $\theta = \{\theta_\Sigma\}_{\Sigma \in |\mathbf{Sign}|}$ **on $\mathbf{F}$** is a family, such that, for all $\Sigma \in |\mathbf{Sign}|$, $\theta_\Sigma = \{\theta_\Sigma^s\}_{s \in S}$ consists of equivalence relations $\theta_\Sigma^s \subseteq \text{SEN}_s(\Sigma)^2$. It is called an **equivalence system on $\mathbf{F}$** if it is invariant under **Sign**-morphisms, i.e., such that, for all $\Sigma, \Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and $s \in S$,

$$\text{SEN}_s(f)(\theta_\Sigma^s) \subseteq \theta_{\Sigma'}^s.$$

An equivalence family/system θ on $\mathbf{F}$ is called a **congruence family/system on $\mathbf{F}$** if, for all $\sigma : \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_s$ in N , all $\Sigma \in |\mathbf{Sign}|$ and all $\vec{\phi}, \vec{\psi} \in \prod_{i=1}^k \text{SEN}_{s_i}(\Sigma)$,

$$\vec{\phi} \prod_{i=1}^k \theta_\Sigma^{s_i} \vec{\psi} \text{ implies } \sigma_\Sigma(\vec{\phi}) \theta_\Sigma^s \sigma_\Sigma(\vec{\psi}).$$

The collection of all congruence systems on $\mathbf{F}$ is denoted by $\text{ConSys}(\mathbf{F})$ and it forms a complete lattice under signature-wise and sort-wise inclusion $\leq$:

$$\text{ConSys}(\mathbf{F}) = \langle \text{ConSys}(\mathbf{F}), \leq \rangle.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $T = \{T_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$ a behavioral sentence family of $\mathbf{F}$. A congruence family $\theta = \{\theta_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$ on $\mathbf{F}$ is **compatible with** T if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v(\Sigma)$,

$$\langle \phi, \psi \rangle \in \theta_\Sigma^v \quad \text{and} \quad \phi \in T_\Sigma \quad \text{imply} \quad \psi \in T_\Sigma.$$

A fundamental result, akin to that allowing us to define Leibniz congruence systems in the context of ordinary π -institutions, is asserting that, given a behavioral sentence family, there exists a largest congruence system on $\mathbf{F}$ compatible with the theory family.

Theorem 1995 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system, $T = \{T_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$ a behavioral sentence family of $\mathbf{F}$. There exists a largest congruence system on $\mathbf{F}$ compatible with T .*

Proof: We define $\theta = \{\theta_\Sigma\}_{\Sigma \in |\mathbf{Sign}^b|}$, where $\theta_\Sigma = \{\theta_\Sigma^s\}_{s \in S}$ by setting, for all $\Sigma \in |\mathbf{Sign}^b|$, all $s \in S$ and all $\phi, \psi \in \text{SEN}_s^b(\Sigma)$, $\langle \phi, \psi \rangle \in \theta_\Sigma^s$ if and only if, for all $\sigma : \text{SEN}_s^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b$ in N^b , with $v \in V$, all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma')$,

$$\sigma_{\Sigma'}(\text{SEN}_s^b(f)(\phi), \vec{\chi}) \in T_{\Sigma'} \quad \text{iff} \quad \sigma_{\Sigma'}(\text{SEN}_s^b(f)(\psi), \vec{\chi}) \in T_{\Sigma'}.$$

We show that θ , thus defined, is a congruence system on $\mathbf{F}$ that is compatible with T .

First, it is straightforward by the definition that, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $s \in S$, θ_Σ^s is reflexive, symmetric and transitive. So θ is an equivalence family on $\mathbf{F}$. To see that it is a system, let $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, $s \in S$ and $\phi, \psi \in \text{SEN}_s^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \theta_\Sigma^s$. Then, for all $\sigma : \text{SEN}_s^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b$ in N^b , with $v \in V$, all $\Sigma'' \in |\mathbf{Sign}^b|$, all $h \in \mathbf{Sign}^b(\Sigma, \Sigma'')$ and all $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma'')$,

$$\sigma_{\Sigma''}(\text{SEN}_s^b(h)(\phi), \vec{\chi}) \in T_{\Sigma''} \quad \text{iff} \quad \sigma_{\Sigma''}(\text{SEN}_s^b(h)(\psi), \vec{\chi}) \in T_{\Sigma''}.$$

Thus, as fortiori, for all $\sigma : \text{SEN}_s^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b$ in N^b , with $v \in V$, all $\Sigma'' \in |\mathbf{Sign}^b|$, all $g \in \mathbf{Sign}^b(\Sigma', \Sigma'')$ and all $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma'')$,

$$\begin{array}{ccc} \Sigma & \xrightarrow{f} & \Sigma' \\ & \searrow h \quad \swarrow g & \\ & \Sigma'' & \end{array}$$

$$\begin{aligned} \sigma_{\Sigma''}(\text{SEN}_s^b(g)(\text{SEN}_s^b(f)(\phi)), \vec{\chi}) &\in T_{\Sigma''} \\ \text{iff } \sigma_{\Sigma''}(\text{SEN}_s^b(g)(\text{SEN}_s^b(f)(\psi)), \vec{\chi}) &\in T_{\Sigma''}. \end{aligned}$$

This shows that $\langle \text{SEN}_s^b(f)(\phi), \text{SEN}_s^b(f)(\psi) \rangle \in \theta_{\Sigma'}^s$, and, hence, θ is an equivalence system.

To see that θ is a congruence system, let $\tau : \prod_{j=1}^{\ell} \text{SEN}_{s'_j}^b \rightarrow \text{SEN}_s^b$ be in N^b , $\Sigma \in |\mathbf{Sign}^b|$ and $\vec{\phi}, \vec{\psi} \in \prod_{j=1}^{\ell} \text{SEN}_{s'_j}^b(\Sigma)$, such that $\vec{\phi} \prod_{j=1}^{\ell} \theta_{\Sigma}^{s'_j} \vec{\psi}$. Then, we have, for all $\sigma : \text{SEN}_s^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b$ in N^b , with $v \in V$, all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma')$,

$$\begin{aligned} &\sigma_{\Sigma'}(\text{SEN}_s^b(f)(\tau_{\Sigma}(\vec{\phi})), \vec{\chi}) \in T_{\Sigma'} \\ \text{iff } &\sigma_{\Sigma'}(\tau_{\Sigma'}(\text{SEN}_{s'_1}^b(f)(\phi_1), \text{SEN}_{s'_2}^b(f)(\phi_2), \text{SEN}_{s'_3}^b(f)(\phi_3), \dots, \\ &\quad \text{SEN}_{s'_{\ell-1}}^b(f)(\phi_{\ell-1}), \text{SEN}_{s'_{\ell}}^b(f)(\phi_{\ell})), \vec{\chi}) \in T_{\Sigma'} \\ \text{iff } &\sigma_{\Sigma'}(\tau_{\Sigma'}(\text{SEN}_{s'_1}^b(f)(\psi_1), \text{SEN}_{s'_2}^b(f)(\psi_2), \text{SEN}_{s'_3}^b(f)(\psi_3), \dots, \\ &\quad \text{SEN}_{s'_{\ell-1}}^b(f)(\psi_{\ell-1}), \text{SEN}_{s'_{\ell}}^b(f)(\psi_{\ell})), \vec{\chi}) \in T_{\Sigma'} \\ \text{iff } &\sigma_{\Sigma'}(\tau_{\Sigma'}(\text{SEN}_{s'_1}^b(f)(\psi_1), \text{SEN}_{s'_2}^b(f)(\psi_2), \text{SEN}_{s'_3}^b(f)(\psi_3), \dots, \\ &\quad \text{SEN}_{s'_{\ell-1}}^b(f)(\psi_{\ell-1}), \text{SEN}_{s'_{\ell}}^b(f)(\psi_{\ell})), \vec{\chi}) \in T_{\Sigma'} \\ \text{iff...} & \\ \text{iff } &\sigma_{\Sigma'}(\tau_{\Sigma'}(\text{SEN}_{s'_1}^b(f)(\psi_1), \text{SEN}_{s'_2}^b(f)(\psi_2), \text{SEN}_{s'_3}^b(f)(\psi_3), \dots, \\ &\quad \text{SEN}_{s'_{\ell-1}}^b(f)(\psi_{\ell-1}), \text{SEN}_{s'_{\ell}}^b(f)(\psi_{\ell})), \vec{\chi}) \in T_{\Sigma'} \\ \text{iff } &\sigma_{\Sigma'}(\tau_{\Sigma'}(\text{SEN}_{s'_1}^b(f)(\psi_1), \text{SEN}_{s'_2}^b(f)(\psi_2), \text{SEN}_{s'_3}^b(f)(\psi_3), \dots, \\ &\quad \text{SEN}_{s'_{\ell-1}}^b(f)(\psi_{\ell-1}), \text{SEN}_{s'_{\ell}}^b(f)(\psi_{\ell})), \vec{\chi}) \in T_{\Sigma'} \\ \text{iff } &\sigma_{\Sigma'}(\text{SEN}_s^b(f)(\tau_{\Sigma}(\vec{\psi})), \vec{\chi}) \in T_{\Sigma'}. \end{aligned}$$

Hence, $\langle \tau_{\Sigma}(\vec{\phi}), \tau_{\Sigma}(\vec{\psi}) \rangle \in \theta_{\Sigma}^s$, showing that θ is a congruence system on $\mathbf{F}$.

θ is also compatible with T , since, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\psi, \phi \in \text{SEN}_v^b(\Sigma)$, such that $\phi \in T_{\Sigma}$ and $\langle \phi, \psi \rangle \in \theta_{\Sigma}^v$, we get, as a special instance in the definition by taking $\sigma = \iota : \text{SEN}_v^b \rightarrow \text{SEN}_v^b$ in N^b , $\Sigma' = \Sigma$ and $f = i_{\Sigma}$, $\phi \in T_{\Sigma}$ iff $\psi \in T_{\Sigma}$. Therefore, $\psi \in T_{\Sigma}$ and θ is, in fact, a congruence system on $\mathbf{F}$ compatible with T .

Finally, we show that, if θ' is a congruence system on $\mathbf{F}$ compatible with T , then $\theta' \leq \theta$. Suppose, to this end, that θ' is a congruence system on $\mathbf{F}$ compatible with T and let $\Sigma \in |\mathbf{Sign}^b|$, $s \in S$ and $\phi, \psi \in \text{SEN}_s^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \theta_{\Sigma}^s$. Then, since θ' is a congruence system, for all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, $\langle \text{SEN}_s^b(f)(\phi), \text{SEN}_s^b(f)(\psi) \rangle \in \theta_{\Sigma'}^s$. Thus, since θ' is a congruence system, for all $\sigma : \text{SEN}_s^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b$ in N^b , with $v \in V$, and all $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma')$,

$$\langle \sigma_{\Sigma'}(\text{SEN}_s^b(f)(\phi), \vec{\chi}), \sigma_{\Sigma'}(\text{SEN}_s^b(f)(\psi), \vec{\chi}) \rangle \in \theta_{\Sigma'}^v.$$

Therefore, by the compatibility of θ' with T , we get

$$\sigma_{\Sigma'}(\text{SEN}_s^b(f)(\phi), \vec{\chi}) \in T_{\Sigma'} \quad \text{iff} \quad \sigma_{\Sigma'}(\text{SEN}_s^b(f)(\psi), \vec{\chi}) \in T_{\Sigma'}.$$

This shows that $\langle \phi, \psi \rangle \in \theta_\Sigma^s$ and, hence, $\theta' \leq \theta$. Thus, θ is indeed the largest congruence system on $\mathbf{F}$ compatible with T . $\blacksquare$

The largest congruence system on $\mathbf{F}$ compatible with T is called the **behavioral Leibniz congruence system of T on $\mathbf{F}$** and is denoted by $\Upsilon(T)$. Moreover, given a behavioral π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$, and a behavioral theory family $T \in \text{ThFam}(\mathcal{I})$, we define the **behavioral Suszko congruence system of T on $\mathbf{F}$** by

$$\tilde{\Upsilon}^{\mathcal{I}}(T) = \bigcap \{ \Upsilon(T') : T \leq T' \in \text{ThFam}(\mathcal{I}) \}.$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{ \text{SEN}_s^b \}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \{ \text{SEN}_s \}_{s \in S}, N \rangle$, an $\mathbf{F}$ -algebraic system. We define $\equiv^{\mathcal{A}} = \{ \equiv_\Sigma^{\mathcal{A}} \}_{\Sigma \in |\mathbf{Sign}|}$, where, for all $\Sigma \in |\mathbf{Sign}|$, $\equiv_\Sigma^{\mathcal{A}} = \{ \equiv_\Sigma^{\mathcal{A}, s} \}_{s \in S}$ is given, for all $s \in S$, all $\phi, \psi \in \text{SEN}_s(\Sigma)$, by $\phi \equiv_\Sigma^{\mathcal{A}, s} \psi$ if and only if, for all $\sigma : \text{SEN}_s \times \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_{v^*}$, with $v \in V$, all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\tilde{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}(\Sigma')$,

$$\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}_s(f)(\phi), \tilde{\chi}) = \sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}_s(f)(\psi), \tilde{\chi}).$$

We show that $\equiv^{\mathcal{A}}$ is a congruence system on $\mathcal{A}$.

Proposition 1996 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{ \text{SEN}_s^b \}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, with $\mathbf{A} = \langle \mathbf{Sign}, \{ \text{SEN}_s \}_H^{V, V^*}, N \rangle$, an $\mathbf{F}$ -algebraic system. The relation family $\equiv^{\mathcal{A}}$ is a congruence system on $\mathcal{A}$.*

Proof: By the definition, it is obvious that, for all $\Sigma \in |\mathbf{Sign}|$ and all $s \in S$, $\equiv_\Sigma^{\mathcal{A}, s}$ is an equivalence family on $\text{SEN}_s(\Sigma)$. We show that $\equiv^{\mathcal{A}}$ is a system and that it satisfies the congruence property.

Let $\Sigma, \Sigma' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma')$, $s \in S$ and $\phi, \psi \in \text{SEN}_s(\Sigma)$, such that $\phi \equiv_\Sigma^{\mathcal{A}, s} \psi$. Then, for all $\sigma : \text{SEN}_s \times \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_{v^*}$, with $v \in V$, all $\Sigma'' \in |\mathbf{Sign}|$, $f \in \mathbf{Sign}(\Sigma, \Sigma'')$ and $\tilde{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}(\Sigma'')$,

$$\sigma_{\Sigma''}^{\mathcal{A}}(\text{SEN}_s(h)(\phi), \tilde{\chi}) = \sigma_{\Sigma''}^{\mathcal{A}}(\text{SEN}_s(h)(\psi), \tilde{\chi}).$$

In particular, for all $g \in \mathbf{Sign}(\Sigma', \Sigma'')$ and all $\tilde{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}(\Sigma'')$,

$$\begin{array}{ccc} \Sigma & \xrightarrow{f} & \Sigma' \\ & \searrow h & \swarrow g \\ & \Sigma'' & \end{array}$$

$$\sigma_{\Sigma''}^{\mathcal{A}}(\text{SEN}_s(g)(\text{SEN}_s(f)(\phi)), \tilde{\chi}) = \sigma_{\Sigma''}^{\mathcal{A}}(\text{SEN}_s(g)(\text{SEN}_s(f)(\psi)), \tilde{\chi}).$$

Thus, by definition, $\text{SEN}_s(f)(\phi) \equiv_{\Sigma'}^{\mathcal{A}, s} \text{SEN}_s(f)(\psi)$ and, therefore, $\equiv^{\mathcal{A}}$ is an equivalence system.

Finally, let $\sigma : \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_s$ be in N , $\Sigma \in |\mathbf{Sign}|$ and $\vec{\phi}, \vec{\psi} \in \prod_{i=1}^k \text{SEN}_{s_i}(\Sigma)$, such that $\vec{\phi} \prod_{i=1}^k \equiv_{\Sigma}^{\mathcal{A}, s_i} \vec{\psi}$. Then, we have, for all $\tau : \text{SEN}_s \times \prod_{j=1}^{\ell} \text{SEN}_{s'_j} \rightarrow \text{SEN}_{v^*}$, with $v \in V$, all $\Sigma' \in |\mathbf{Sign}|$, all $f \in \mathbf{Sign}(\Sigma, \Sigma')$ and all $\vec{\chi} \in \prod_{j=1}^{\ell} \text{SEN}_{s'_j}(\Sigma')$,

$$\begin{aligned}
& \tau_{\Sigma'}^{\mathcal{A}}(\text{SEN}_s(f)(\sigma_{\Sigma}^{\mathcal{A}}(\vec{\phi})), \vec{\chi}) \\
&= \tau_{\Sigma'}^{\mathcal{A}}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}_{s_1}(f)(\phi_1), \text{SEN}_{s_2}(f)(\phi_2), \text{SEN}_{s_3}(f)(\phi_3), \dots, \\
&\quad \text{SEN}_{s_{k-1}}(f)(\phi_{k-1}), \text{SEN}_{s_k}(f)(\phi_k)), \vec{\chi}) \\
&= \tau_{\Sigma'}^{\mathcal{A}}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}_{s_1}(f)(\psi_1), \text{SEN}_{s_2}(f)(\phi_2), \text{SEN}_{s_3}(f)(\phi_3), \dots, \\
&\quad \text{SEN}_{s_{k-1}}(f)(\phi_{k-1}), \text{SEN}_{s_k}(f)(\phi_k)), \vec{\chi}) \\
&= \tau_{\Sigma'}^{\mathcal{A}}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}_{s_1}(f)(\psi_1), \text{SEN}_{s_2}(f)(\psi_2), \text{SEN}_{s_3}(f)(\phi_3), \dots, \\
&\quad \text{SEN}_{s_{k-1}}(f)(\phi_{k-1}), \text{SEN}_{s_k}(f)(\phi_k)), \vec{\chi}) \\
&= \dots \\
&= \tau_{\Sigma'}^{\mathcal{A}}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}_{s_1}(f)(\psi_1), \text{SEN}_{s_2}(f)(\psi_2), \text{SEN}_{s_3}(f)(\psi_3), \dots, \\
&\quad \text{SEN}_{s_{k-1}}(f)(\psi_{k-1}), \text{SEN}_{s_k}(f)(\phi_k)), \vec{\chi}) \\
&= \tau_{\Sigma'}^{\mathcal{A}}(\sigma_{\Sigma'}^{\mathcal{A}}(\text{SEN}_{s_1}(f)(\psi_1), \text{SEN}_{s_2}(f)(\psi_2), \text{SEN}_{s_3}(f)(\psi_3), \dots, \\
&\quad \text{SEN}_{s_{k-1}}(f)(\psi_{k-1}), \text{SEN}_{s_k}(f)(\psi_k)), \vec{\chi}) \\
&= \tau_{\Sigma'}^{\mathcal{A}}(\text{SEN}_s(f)(\sigma_{\Sigma}^{\mathcal{A}}(\vec{\psi})), \vec{\chi})
\end{aligned}$$

Hence, $\sigma_{\Sigma}^{\mathcal{A}}(\vec{\phi}) \equiv_{\Sigma}^{\mathcal{A}, s} \sigma_{\Sigma}^{\mathcal{A}}(\vec{\psi})$ and $\equiv^{\mathcal{A}}$ is a congruence system on $\{\text{SEN}_s\}_H^{V, V^*}$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems. We define the closure system $C^{\mathbf{K}} = \{C_{\Sigma}^{\mathbf{K}}\}_{\Sigma \in |\mathbf{Sign}^b|}$ by letting, for all $\Sigma \in |\mathbf{Sign}^b|$,

$$C_{\Sigma}^{\mathbf{K}} : \mathcal{P}(\bigcup_{v \in V} \text{SEN}_v^b(\Sigma)^2) \rightarrow \mathcal{P}(\bigcup_{v \in V} \text{SEN}_v^b(\Sigma)^2)$$

be given, for all $E \cup \{\phi \approx \psi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)^2$,

$$\begin{aligned}
\phi \approx \psi \in C_{\Sigma}^{\mathbf{K}}(E) \quad \text{iff} \quad & \text{for all } \mathcal{A} \in \mathbf{K}, \Sigma' \in |\mathbf{Sign}^b|, f \in \mathbf{Sign}^b(\Sigma, \Sigma'), \\
& \alpha_{\Sigma'}(\text{SEN}^b(f)(E)) \subseteq \equiv_{F(\Sigma')}^{\mathcal{A}} \text{ implies} \\
& \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi)) \equiv_{F(\Sigma')}^{\mathcal{A}} \alpha_{\Sigma'}(\text{SEN}^b(f)(\psi)).
\end{aligned}$$

Proposition 1997 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems. Then $C^{\mathbf{K}}$ is a closure system on $\bigcup_{v \in V} (\text{SEN}_v^b)^2$.*

Proof: It is straightforward to check that $C_{\Sigma}^{\mathbf{K}}$ is inflationary, monotone and idempotent, for all $\Sigma \in |\mathbf{Sign}^b|$. The fact that it is invariant under $\mathbf{Sign}^b$ -morphisms can be shown in a way similar to that in the proof of Proposition 1996. ■

We call $\mathcal{I}^{\mathbf{K}} = \langle \mathbf{F}, C^{\mathbf{K}} \rangle$ the **behavioral equational π -institution associated with** the class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems.

27.3 Behavioral Algebraizability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system, $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$.

- A **transformation** τ from $\mathcal{I}$ to $\mathcal{I}^{\mathbf{K}}$ is a collection $\tau = \{\tau^v : v \in V\}$, where, for every $v \in V$, $\tau^v = \{\tau^{v,u} : u \in V\}$ is such that

$$\tau^{v,u} : \text{SEN}_v^b \times \prod_{i < \omega} \text{SEN}_{s_i}^b \rightarrow (\text{SEN}_u^b)^2$$

is a collection of natural transformations in N^b ;

- A **transformation** ρ from $\mathcal{I}^{\mathbf{K}}$ to $\mathcal{I}$ is a collection $\rho = \{\rho^v : v \in V\}$, where, for every $v \in V$, $\rho^v = \{\rho^{v,u} : u \in V\}$ is such that

$$\rho^{v,u} : (\text{SEN}_v^b)^2 \times \prod_{i < \omega} \text{SEN}_{s_i}^b \rightarrow \text{SEN}_u^b$$

is a collection of natural transformations in N^b .

A transformation τ from $\mathcal{I}$ to $\mathcal{I}^{\mathbf{K}}$ is called an **interpretation**, written $\tau : \mathcal{I} \rightarrow \mathcal{I}^{\mathbf{K}}$, if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\Phi \cup \{\phi\} \subseteq \bigcup_{v \in V} \text{SEN}_v(\Sigma)$,

$$\phi \in C_{\Sigma}(\Phi) \quad \text{iff} \quad \tau_{\Sigma}[\phi] \in C_{\Sigma}^{\mathbf{K}}(\tau_{\Sigma}[\Phi]).$$

Similarly, a transformation ρ from $\mathcal{I}^{\mathbf{K}}$ to $\mathcal{I}$ is called an **interpretation**, written $\rho : \mathcal{I}^{\mathbf{K}} \rightarrow \mathcal{I}$, if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $E \cup \{\phi \approx \psi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)^2$,

$$\phi \approx \psi \in C_{\Sigma}^{\mathbf{K}}(E) \quad \text{iff} \quad \rho_{\Sigma}[\phi, \psi] \in C_{\Sigma}(\rho_{\Sigma}[E]).$$

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is said to be **behaviorally (syntactically WF) algebraizable** if there exists a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems and interpretations $\tau : \mathcal{I} \rightarrow \mathcal{I}^{\mathbf{K}}$, $\rho : \mathcal{I}^{\mathbf{K}} \rightarrow \mathcal{I}$, that form a **conjugate pair**, i.e., such that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$,

- $C_{\Sigma}(\phi) = C_{\Sigma}(\rho_{\Sigma}[\tau_{\Sigma}[\phi]])$;
- $C_{\Sigma}^{\mathbf{K}}(\phi \approx \psi) = C_{\Sigma}^{\mathbf{K}}(\tau_{\Sigma}[\rho_{\Sigma}[\phi, \psi]])$.

In this case we also say that $\mathcal{I}$ and $\mathcal{I}^{\mathbf{K}}$ are **equivalent via** (τ, ρ) and we write $(\tau, \rho) : \mathcal{I} \rightleftharpoons \mathcal{I}^{\mathbf{K}}$.

Explicitly, $\mathcal{I}$ is behaviorally algebraizable if and only if, there exists a class $\mathbf{K}$ of $\mathbf{F}$ -algebraic systems and translations τ from $\mathcal{I}$ to $\mathcal{I}^{\mathbf{K}}$ and ρ from $\mathcal{I}^{\mathbf{K}}$ to $\mathcal{I}$, such that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $\Phi \cup \{\phi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)$ and all $E \cup \{\phi \approx \psi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)^2$,

- (1) $\phi \in C_\Sigma(\Phi)$ if and only if $\tau_\Sigma[\phi] \subseteq C_\Sigma^K(\tau_\Sigma[\Phi])$;
- (2) $\phi \approx \psi \in C_\Sigma^K(E)$ if and only if $\rho_\Sigma[\phi, \psi] \subseteq C_\Sigma(\rho_\Sigma[E])$;
- (3) $C_\Sigma(\phi) = C_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]])$;
- (4) $C_\Sigma^K(\phi \approx \psi) = C_\Sigma^K(\tau_\Sigma[\rho_\Sigma[\phi, \psi]])$.

As in normal syntactic WF algebraizability, it turns out that, in this case as well, Conditions (1) and (4), or dually, Conditions (2) and (3) suffice to establish behavioral algebraizability.

Proposition 1998 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$, $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems and τ, ρ translations from $\mathcal{I}$ to $\mathcal{I}^{\mathbf{K}}$ and from $\mathcal{I}^{\mathbf{K}}$ to $\mathcal{I}$, respectively. The following statements are equivalent:*

- (i) $\tau : \mathcal{I} \rightarrow \mathcal{I}^{\mathbf{K}}$ is an interpretation and, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \approx \psi \in \text{SEN}_v^b(\Sigma)$, $C_\Sigma^K(\phi \approx \psi) = C_\Sigma^K(\tau_\Sigma[\rho_\Sigma[\phi, \psi]])$;
- (ii) $\rho : \mathcal{I}^{\mathbf{K}} \rightarrow \mathcal{I}$ is an interpretation and, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \text{SEN}_v^b(\Sigma)$, $C_\Sigma(\phi) = C_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]])$.

Proof: We only prove that (i) implies (ii), since the converse then follows by the symmetry of the notion of equivalence. Suppose that (i) holds and let $\Sigma \in |\mathbf{Sign}^b|$ and $E \cup \{\phi \approx \psi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)^2$. Then we have

$$\begin{aligned} \phi \approx \psi \in C_\Sigma^K(E) & \text{ iff } \tau_\Sigma[\rho_\Sigma[\phi, \psi]] \subseteq C_\Sigma^K(\tau_\Sigma[\rho_\Sigma[E]]) \\ & \text{ iff } \rho_\Sigma[\phi, \psi] \subseteq C_\Sigma(\rho_\Sigma[E]). \end{aligned}$$

Moreover, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \text{SEN}_v^b(\Sigma)$, we have, for all $\psi \in \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)$,

$$\begin{aligned} \psi \in C_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]]) & \text{ iff } \tau_\Sigma[\psi] \subseteq C_\Sigma^K(\tau_\Sigma[\rho_\Sigma[\tau_\Sigma[\phi]]]) \\ & \text{ iff } \tau_\Sigma[\psi] \subseteq C_\Sigma^K(\tau_\Sigma[\phi]) \\ & \text{ iff } \psi \in C_\Sigma(\phi). \end{aligned}$$

Hence, $C_\Sigma(\phi) = C_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]])$. This shows that Condition (ii) holds. $\blacksquare$

We look next at some properties that are entailed by behavioral algebraizability.

Proposition 1999 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$ and $\mathbf{K}$ a class of $\mathbf{F}$ -algebraic systems. If $(\tau, \rho) : \mathcal{I} \rightleftarrows \mathcal{I}^{\mathbf{K}}$ is a conjugate pair, then, for all $v, u \in V$, all $\sigma : \text{SEN}_v \times \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_u$ in N^b , all $\Sigma \in |\mathbf{Sign}^b|$, all $\phi, \psi, \chi \in \text{SEN}_v^b(\Sigma)$ and all $\tilde{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma)$,*

- (a) $\rho_\Sigma[\phi, \phi] \subseteq \text{Thm}_\Sigma(\mathcal{I})$;
- (b) $\rho_\Sigma[\psi, \phi] \subseteq C_\Sigma(\rho_\Sigma[\phi, \psi])$;
- (c) $\rho_\Sigma[\phi, \chi] \subseteq C_\Sigma[\rho_\Sigma[\phi, \psi], \rho_\Sigma[\psi, \chi]]$;
- (d) $\rho_\Sigma[\sigma_\Sigma(\phi, \vec{\chi}), \sigma_\Sigma(\psi, \vec{\chi})] \subseteq C_\Sigma(\rho_\Sigma[\phi, \psi])$;
- (e) $\psi \in C_\Sigma(\phi, \rho_\Sigma[\phi, \psi])$.

Proof:

- (a) We have $\phi \approx \phi \in C_\Sigma^K(\emptyset)$, whence, since $\rho : \mathcal{I}^K \rightarrow \mathcal{I}$ is an interpretation, $\rho_\Sigma[\phi, \phi] \subseteq C_\Sigma(\emptyset)$.
- (b) Since $\psi \approx \phi \in C_\Sigma^K(\phi \approx \psi)$, we get, again by the fact $\rho : \mathcal{I}^K \rightarrow \mathcal{I}$ is an interpretation, $\rho_\Sigma[\psi, \phi] \subseteq C_\Sigma(\rho_\Sigma[\phi, \psi])$.
- (c) Since $\phi \approx \chi \in C_\Sigma^K(\phi \approx \psi, \psi \approx \chi)$ and $\rho : \mathcal{I}^K \rightarrow \mathcal{I}$ is an interpretation, we get that $\rho_\Sigma[\phi, \chi] \subseteq C_\Sigma(\rho_\Sigma[\phi, \psi], \rho_\Sigma[\psi, \chi])$.
- (d) By Proposition 1996, we have, for all $\sigma : \text{SEN}_v \times \prod_{i=1}^k \text{SEN}_{s_i} \rightarrow \text{SEN}_u$ and all $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma)$, $\sigma_\Sigma(\phi, \vec{\chi}) \approx \sigma_\Sigma(\psi, \vec{\chi}) \in C_\Sigma^K(\phi \approx \psi)$. Hence, again by the fact that $\rho : \mathcal{I}^K \rightarrow \mathcal{I}$ is an interpretation, we get that $\rho_\Sigma[\sigma_\Sigma(\phi, \vec{\chi}), \sigma_\Sigma(\psi, \vec{\chi})] \subseteq C_\Sigma(\rho_\Sigma[\phi, \psi])$.
- (e) In $\mathcal{I}^K$, we have $\tau_\Sigma[\psi] \subseteq C_\Sigma^K(\tau_\Sigma[\phi], \phi \approx \psi)$. Hence, by Property (4) of equivalence, $\tau_\Sigma[\psi] \subseteq C_\Sigma^K(\tau_\Sigma[\phi], \tau_\Sigma[\rho_\Sigma[\phi, \psi]])$. Thus, by Property (1) of equivalence, we get that $\psi \in C_\Sigma(\phi, \rho_\Sigma[\phi, \psi])$. ■

We can also prove that, if a behavioral π -institution $\mathcal{I}$ is behaviorally algebraizable in two different ways, then the interpretations are, roughly speaking, interderivable and the classes of $\mathbf{F}$ -algebraic systems serving as behavioral algebraic semantics generate the same behavioral consequence operators.

Theorem 2000 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally algebraizable via conjugate pairs $(\tau, \rho) : \mathcal{I} \rightleftarrows \mathcal{I}^K$ and $(\tau', \rho') : \mathcal{I} \rightleftarrows \mathcal{I}^{K'}$, then, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$,*

- (a) $C_\Sigma(\rho_\Sigma[\phi, \psi]) = C_\Sigma(\rho'_\Sigma[\phi, \psi])$;
- (b) $C^K = C^{K'}$;
- (c) $C_\Sigma^K(\tau_\Sigma[\phi]) = C_\Sigma^{K'}(\tau'_\Sigma[\phi])$.

Proof:

- (a) For all $\sigma' \in \rho'$ and all $\tilde{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma)$, we get

$$\rho_\Sigma[\sigma'_\Sigma(\phi, \phi, \tilde{\chi}), \sigma'_\Sigma(\phi, \psi, \tilde{\chi})] \subseteq C_\Sigma(\rho_\Sigma[\phi, \psi]).$$

But we also have $\rho'_\Sigma[\phi, \phi] \subseteq C_\Sigma(\emptyset) \subseteq C_\Sigma(\rho_\Sigma[\phi, \psi])$. Thus, by Proposition 1999, Part (e), $\rho'_\Sigma[\phi, \psi] \subseteq C_\Sigma(\rho_\Sigma[\phi, \psi])$. By symmetry, we now get $C_\Sigma(\rho_\Sigma[\phi, \psi]) = C_\Sigma(\rho'_\Sigma[\phi, \psi])$.

- (b) Using Part (a), we get, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $E \cup \{\phi \approx \psi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)^2$,

$$\begin{aligned} \phi \approx \psi \in C_\Sigma^K(E) & \text{ iff } \rho_\Sigma[\phi, \psi] \subseteq C_\Sigma(\rho_\Sigma[E]) \\ & \text{ iff } \rho'_\Sigma[\phi, \psi] \subseteq C_\Sigma(\rho'_\Sigma[E]) \\ & \text{ iff } \phi \approx \psi \in C_\Sigma^{K'}(E). \end{aligned}$$

- (c) Using Parts (a) and (b), we get

$$\begin{aligned} C_\Sigma(\phi) = C_\Sigma(\psi) & \text{ iff } C_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]]) = C_\Sigma(\rho'_\Sigma[\tau'_\Sigma[\phi]]) \\ & \text{ iff } C_\Sigma(\rho_\Sigma[\tau_\Sigma[\phi]]) = C_\Sigma(\rho_\Sigma[\tau'_\Sigma[\phi]]) \\ & \text{ iff } C_\Sigma^K(\tau_\Sigma[\phi]) = C_\Sigma^K(\tau'_\Sigma[\phi]). \end{aligned}$$

■

27.4 Behavioral Protoalgebraicity

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$.

- $\mathcal{I}$ is **behaviorally protoalgebraic** if the behavioral Leibniz operator $\Upsilon : \text{ThFam}(\mathcal{I}) \rightarrow \text{ConSys}(\mathbf{F})$ is monotone on the behavioral theory families of $\mathcal{I}$, i.e., for all $T, T' \in \text{ThFam}(\mathcal{I})$,

$$T \leq T' \text{ implies } \Upsilon(T) \leq \Upsilon(T').$$

- $\mathcal{I}$ is **behaviorally syntactically protoalgebraic** if there exists a collection $\rho = \{\rho^v : v \in V\}$, where, for all $v \in V$, $\rho^v = \{\rho^{v,u} : u \in V\}$ is such that $\rho^{v,u} : (\text{SEN}_v^b)^2 \times \prod_{i < \omega} \text{SEN}_{s_i}^b \rightarrow \text{SEN}_u^b$ in N^b is a collection of natural transformations satisfying, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$,

$$\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T) \text{ iff } \rho_\Sigma^v[\phi, \psi] \leq T.$$

The set ρ is referred to as the set of **witnessing transformations** for the behavioral syntactic protoalgebraicity of $\mathcal{I}$.

We have the following characterization of behavioral protoalgebraicity.

Proposition 2001 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally protoalgebraic if and only if, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$,*

$$\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T) \quad \text{implies} \quad C_\Sigma(T_\Sigma, \phi) = C_\Sigma(T_\Sigma, \psi).$$

Proof: Suppose, first, that $\mathcal{I}$ is behaviorally protoalgebraic and let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi, \psi \in \text{SEN}_v^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T)$. Let $T' \in \text{ThFam}(\mathcal{I})$, such that $T_\Sigma \subseteq T'_\Sigma$ and $\psi \in T'_\Sigma$. Then, by behavioral protoalgebraicity, we have $\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T) \subseteq \Upsilon_\Sigma(T')$. Since, by hypothesis, $\psi \in T'_\Sigma$, we get, by compatibility of $\Upsilon(T')$ with T' , that $\phi \in T'_\Sigma$. Thus, $\phi \in C_\Sigma(T_\Sigma, \psi)$ and, by symmetry, $C_\Sigma(T_\Sigma, \phi) = C_\Sigma(T_\Sigma, \psi)$.

Suppose, conversely, that the condition in the statement holds and let $T, T' \in \text{ThFam}(\mathcal{I})$, such that $T \leq T'$ and $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi, \psi \in \text{SEN}_v^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T)$. Then, since $\Upsilon(T)$ is a congruence system on $\mathbf{F}$, we get, for all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, all $\sigma : \text{SEN}_v^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_u^b$ in N^b , with $u \in V$, and all $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma')$,

$$\langle \sigma_{\Sigma'}(\text{SEN}_v^b(f)(\phi), \vec{\chi}), \sigma_{\Sigma'}(\text{SEN}_v^b(f)(\psi), \vec{\chi}) \rangle \in \Upsilon_{\Sigma'}(T).$$

By hypothesis,

$$C_{\Sigma'}(T_{\Sigma'}, \sigma_{\Sigma'}(\text{SEN}_v^b(f)(\phi), \vec{\chi})) = C_{\Sigma'}(T_{\Sigma'}, \sigma_{\Sigma'}(\text{SEN}_v^b(f)(\psi), \vec{\chi})).$$

Hence, since $T \leq T'$,

$$C_{\Sigma'}(T'_{\Sigma'}, \sigma_{\Sigma'}(\text{SEN}_v^b(f)(\phi), \vec{\chi})) = C_{\Sigma'}(T'_{\Sigma'}, \sigma_{\Sigma'}(\text{SEN}_v^b(f)(\psi), \vec{\chi})).$$

We now get

$$\sigma_{\Sigma'}(\text{SEN}_v^b(f)(\phi), \vec{\chi}) \in T'_{\Sigma'} \quad \text{iff} \quad \sigma_{\Sigma'}(\text{SEN}_v^b(f)(\psi), \vec{\chi}) \in T'_{\Sigma'}.$$

Therefore, by the characterization in the proof of Theorem 1995, we get that $\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T')$. Hence $\Upsilon(T) \leq \Upsilon(T')$ and it follows that $\mathcal{I}$ is behaviorally protoalgebraic. $\blacksquare$

Behavioral syntactic protoalgebraicity implies behavioral protoalgebraicity.

Theorem 2002 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally syntactically protoalgebraic, then it is behaviorally protoalgebraic.*

Proof: Suppose $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations ρ , and let $T, T' \in \text{ThFam}(\mathcal{I})$, such that $T \leq T'$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$, we have

$$\begin{aligned} \langle \phi, \psi \rangle \in \Upsilon_\Sigma(T) & \quad \text{iff} \quad \rho_\Sigma^v[\phi, \psi] \leq T \\ & \quad \text{implies} \quad \rho_\Sigma^v[\phi, \psi] \leq T' \\ & \quad \text{iff} \quad \langle \phi, \psi \rangle \in \Upsilon_\Sigma(T'). \end{aligned}$$

Hence, $\Upsilon(T) \leq \Upsilon(T')$ and, therefore, $\mathcal{I}$ is behaviorally protoalgebraic. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_{H^{V,V^*}}^b, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. We define the **behavioral reflexive core of $\mathcal{I}$**

$$A^{\mathcal{I}} = \{A^{\mathcal{I},s} : s \in S\},$$

by letting, for all $s \in S$, $A^{\mathcal{I},s}$ be the collection of all natural transformations $\sigma : (\text{SEN}_s^b)^2 \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b$ in N^b , with $v \in V$, such that:

For all $\Sigma \in |\mathbf{Sign}^b|$, all $s \in S$, all $\phi \in \text{SEN}_s^b(\Sigma)$,

$$\sigma_{\Sigma}[\phi, \phi] \leq \text{Thm}(\mathcal{I}).$$

The importance of the behavioral reflexive core lies, as in previous cases, in the fact that it forms a pool of candidates for drawing witnessing transformations for the behavioral syntactic protoalgebraicity of $\mathcal{I}$.

Lemma 2003 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_{H^{V,V^*}}^b, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations ρ , then $\rho \subseteq A^{\mathcal{I}}$.*

Proof: Suppose $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations ρ . Let $\sigma \in \rho$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \text{SEN}_v^b(\Sigma)$. Since $\langle \phi, \phi \rangle \in \Upsilon_{\Sigma}(\text{Thm}(\mathcal{I}))$, we get that $\sigma_{\Sigma}[\phi, \phi] \leq \rho_{\Sigma}[\phi, \phi] \leq \text{Thm}(\mathcal{I})$. Therefore, we get that $\rho \subseteq A^{\mathcal{I}}$. ■

Moreover, if $\mathcal{I}$ is behaviorally syntactically protoalgebraic, then $A^{\mathcal{I}}$ satisfies a modus ponens property in $\mathcal{I}$.

Theorem 2004 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_{H^{V,V^*}}^b, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally syntactically protoalgebraic, then, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$,*

$$\psi \in C_{\Sigma}(\phi, A_{\Sigma}^{\mathcal{I}}[\phi, \psi]).$$

Proof: Assume $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations ρ and let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi, \psi \in \text{SEN}_v^b(\Sigma)$, such that $\phi \in T_{\Sigma}$ and $A_{\Sigma}^{\mathcal{I}}[\phi, \psi] \leq T$. Then we have $\phi \in T_{\Sigma}$ and, by Lemma 2003, $\rho_{\Sigma}[\phi, \psi] \leq A_{\Sigma}^{\mathcal{I}}[\phi, \psi] \leq T$, whence $\phi \in T_{\Sigma}$ and $\langle \phi, \psi \rangle \in \Upsilon_{\Sigma}(T)$. Thus, by compatibility of $\Upsilon(T)$ with T , we conclude that $\psi \in T_{\Sigma}$. Therefore, $\psi \in C_{\Sigma}(\phi, A_{\Sigma}^{\mathcal{I}}[\phi, \psi])$. ■

Define, for all $T \in \text{ThFam}(\mathcal{I})$, a relation family $A^{\mathcal{I}}(T) = \{A_{\Sigma}^{\mathcal{I}}(T)\}_{\Sigma \in |\mathbf{Sign}^b|}$ on $\mathbf{F}$, by setting, for all $\Sigma \in |\mathbf{Sign}^b|$, all $s \in S$ and all $\phi, \psi \in \text{SEN}_s^b(\Sigma)$,

$$\langle \phi, \psi \rangle \in A_{\Sigma}^{\mathcal{I}}(T) \quad \text{iff} \quad A_{\Sigma}^{\mathcal{I},s}[\phi, \psi] \leq T.$$

Then we have

Lemma 2005 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_{H^{V,V^*}}^V, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$,*

$$\psi \in C_\Sigma(\phi, A_\Sigma^\mathcal{I}[\phi, \psi]),$$

then, for all $T \in \text{ThFam}(\mathcal{I})$, $A^\mathcal{I}(T)$ is a congruence system on $\mathbf{F}$ compatible with T .

Proof: Fix $T \in \text{ThFam}(\mathcal{I})$ and let $\Sigma \in |\mathbf{Sign}^b|$, $s \in S$ and $\phi \in \text{SEN}_s^b(\Sigma)$. By definition of $A^\mathcal{I}$, we have $A_\Sigma^\mathcal{I}[\phi, \phi] \leq \text{Thm}(\mathcal{I}) \leq T$. Therefore, $\langle \phi, \phi \rangle \in A_\Sigma^\mathcal{I}(T)$ and, hence, $A^\mathcal{I}(T)$ is reflexive.

Let $\Sigma \in |\mathbf{Sign}^b|$, $s \in S$ and $\phi, \psi \in \text{SEN}_s^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in A_\Sigma^\mathcal{I}(T)$. Then $A_\Sigma^\mathcal{I}[\phi, \psi] \leq T$. Again by the definition of $A^\mathcal{I}$, we get that $A_\Sigma^\mathcal{I}[\psi, \phi] = A_\Sigma^\mathcal{I}[\phi, \psi] \leq T$, whence $\langle \psi, \phi \rangle \in A_\Sigma^\mathcal{I}(T)$ and $A^\mathcal{I}(T)$ is symmetric.

Let $\Sigma \in |\mathbf{Sign}^b|$, $s \in S$ and $\phi, \psi, \chi \in \text{SEN}_s^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in A_\Sigma^\mathcal{I}(T)$ and $\langle \psi, \chi \rangle \in A_\Sigma^\mathcal{I}(T)$. Then, we have $A_\Sigma^\mathcal{I}[\phi, \psi] \leq T$ and $A_\Sigma^\mathcal{I}[\psi, \chi] \leq T$. Thus, by hypothesis, we have, for all $\alpha \in A^\mathcal{I}$, all $\Sigma, \Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\tilde{\chi} \in \text{SEN}^b(\Sigma')$ of appropriate sorts,

$$\begin{aligned} & \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi), \text{SEN}^b(f)(\chi), \tilde{\chi}) \\ & \in C_{\Sigma'}(\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi), \text{SEN}^b(f)(\psi), \tilde{\chi}), \\ & \quad A_{\Sigma'}^\mathcal{I}[\alpha_{\Sigma'}(\text{SEN}^b(f)(\phi), \text{SEN}^b(f)(\psi), \tilde{\chi}), \\ & \quad \quad \alpha_{\Sigma'}(\text{SEN}^b(f)(\phi), \text{SEN}^b(f)(\chi), \tilde{\chi})]) \\ & \subseteq C_{\Sigma'}(A_\Sigma^\mathcal{I}[\phi, \psi], A_\Sigma^\mathcal{I}[\psi, \chi]) \\ & \subseteq T_{\Sigma'}. \end{aligned}$$

Hence $A_\Sigma^\mathcal{I}[\phi, \chi] \leq T$ and, therefore, $\langle \phi, \chi \rangle \in A_\Sigma^\mathcal{I}(T)$ and $A^\mathcal{I}(T)$ is also transitive. It is, by its definition, a system. To see that it is a congruence system, suppose $\sigma : \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_s^b$ is in $N \Sigma \in |\mathbf{Sign}^b|$ and $\vec{\phi}, \vec{\psi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma)$, such that $\vec{\phi} \prod_{i=1}^k A_\Sigma^{\mathcal{I}, s_i}(T) \vec{\psi}$. Then we have

$$\begin{aligned} A_\Sigma^\mathcal{I}[\sigma_\Sigma(\vec{\phi}), \sigma_\Sigma(\vec{\psi})] \leq T & \text{ iff } A_\Sigma^\mathcal{I}[\sigma_\Sigma(\vec{\phi}), \sigma_\Sigma(\psi_1, \phi_2, \phi_3, \dots, \phi_{k-1}, \phi_k)] \leq T \\ & \text{ iff } A_\Sigma^\mathcal{I}[\sigma_\Sigma(\vec{\phi}), \sigma_\Sigma(\psi_1, \psi_2, \phi_3, \dots, \phi_{k-1}, \phi_k)] \leq T \\ & \text{ iff } \dots \\ & \text{ iff } A_\Sigma^\mathcal{I}[\sigma_\Sigma(\vec{\phi}), \sigma_\Sigma(\psi_1, \psi_2, \psi_3, \dots, \psi_{k-1}, \phi_k)] \leq T \\ & \text{ iff } A_\Sigma^\mathcal{I}[\sigma_\Sigma(\vec{\phi}), \sigma_\Sigma(\vec{\psi})] \leq T. \end{aligned}$$

Therefore, $A^\mathcal{I}(T)$ is a congruence system. Finally, by hypothesis, it is compatible with T . ■

Lemma 2005 enables us to show that, if the behavioral reflexive core of a behavioral π -institution satisfies the modus ponens property postulated in its hypothesis, then it is behaviorally syntactically protoalgebraic, with witnessing transformations $A^{\mathcal{I}, V} = \{A^{\mathcal{I}, v} : v \in V\}$.

Theorem 2006 Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$,

$$\psi \in C_\Sigma(\phi, A_\Sigma^\mathcal{I}[\phi, \psi]),$$

then $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations $A^{\mathcal{I},V} = \{A^{\mathcal{I},v} : v \in V\}$.

Proof: Suppose that $\mathcal{I}$ satisfies the condition in the hypothesis. Let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$.

- Assume, first, that $\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T)$. Then, since $\Upsilon(T)$ is a congruence system on $\mathbf{F}$, we have, for all $\sigma : (\mathbf{SEN}_v^b)^2 \times \prod_{i=1}^k \mathbf{SEN}_{s_i}^b \rightarrow \mathbf{SEN}_u^b$ in $A^{\mathcal{I},v}$, all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\vec{\chi} \in \prod_{i=1}^k \mathbf{SEN}_{s_i}^b(\Sigma')$,

$$\begin{aligned} &\langle \sigma_{\Sigma'}(\mathbf{SEN}_v^b(f)(\phi), \mathbf{SEN}_v^b(f)(\psi), \vec{\chi}), \\ &\sigma_{\Sigma'}(\mathbf{SEN}_v^b(f)(\phi), \mathbf{SEN}_v^b(f)(\psi), \vec{\chi}) \rangle \in \Upsilon_{\Sigma'}(T). \end{aligned}$$

But, by definition of $A^\mathcal{I}$, we also have that

$$\sigma_{\Sigma'}(\mathbf{SEN}_v^b(f)(\phi), \mathbf{SEN}_v^b(f)(\psi), \vec{\chi}) \in \text{Thm}_{\Sigma'}(\mathcal{I}) \subseteq T_{\Sigma'}.$$

Hence, by the compatibility property of $\Upsilon(T)$ with T , we get that $\sigma_{\Sigma'}(\mathbf{SEN}_v^b(f)(\phi), \mathbf{SEN}_v^b(f)(\psi), \vec{\chi}) \in T_{\Sigma'}$. Thus, $A_\Sigma^{\mathcal{I},v}[\phi, \psi] \leq T$.

- Assume, conversely, that $A_\Sigma^{\mathcal{I},v}[\phi, \psi] \leq T$. Then, we get $\langle \phi, \psi \rangle \in A_\Sigma^\mathcal{I}(T)$. But, by Lemma 2005 and the hypothesis, $A^\mathcal{I}(T)$ is a congruence system on $\mathbf{F}$ compatible with T , whence, by the maximality of $\Upsilon(T)$, $A^\mathcal{I}(T) \leq \Upsilon(T)$. Thus, $\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T)$.

We now conclude that $\mathcal{I}$ is behaviorally syntactically protoalgebraic. ■

We have now the essential ingredients for formulating a characterization of behavioral syntactic protoalgebraicity.

$\mathcal{I}$ is behaviorally syntactically protoalgebraic $\iff A^{\mathcal{I},V}$ has the MP.

Theorem 2007 Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally syntactically protoalgebraic if and only if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$, $\psi \in C_\Sigma(\phi, A_\Sigma^{\mathcal{I},v}[\phi, \psi])$.

Proof: The “only if” is by Theorem 2004. The “if” is by Theorem 2006. ■

It is not difficult to show now that, if a behavioral π -institution is behaviorally syntactically protoalgebraic, then any set of witnessing transformations is deductively equivalent to the visible part of the behavioral reflexive core.

Corollary 2008 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations ρ , then, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$,*

$$C(A_{\Sigma}^{\mathcal{I},v}[\phi, \psi]) = C(\rho_{\Sigma}^v[\phi, \psi]).$$

Proof: Suppose $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations ρ . Then, by Theorems 2004 and 2006, $A^{\mathcal{I},V}$ is also a collection of witnessing transformations for the behavioral syntactic protoalgebraicity of $\mathcal{I}$. Therefore, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$, we get

$$\begin{aligned} A_{\Sigma}^{\mathcal{I},v}[\phi, \psi] \leq T & \text{ iff } \langle \phi, \psi \rangle \in \Upsilon_{\Sigma}(T) \\ & \text{ iff } \rho_{\Sigma}^v[\phi, \psi] \leq T. \end{aligned}$$

Hence, we get $C(A_{\Sigma}^{\mathcal{I},v}[\phi, \psi]) = C(\rho_{\Sigma}^v[\phi, \psi])$. ■

Another characterizing property, therefore, of behavioral syntactic protoalgebraicity is that the behavioral reflexive core define behavioral Leibniz congruence systems in $\mathcal{I}$.

$\mathcal{I}$ is behaviorally syntactically protoalgebraic
 $\longleftrightarrow A^{\mathcal{I},V}$ defines behavioral Leibniz congruence systems.

Theorem 2009 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally syntactically protoalgebraic if and only if $A^{\mathcal{I},V}$ defines behavioral Leibniz congruence systems of theory families in $\mathcal{I}$, i.e., for all $T \in \text{ThFam}(\mathcal{I})$, $A^{\mathcal{I},V}(T) = \Upsilon(T)$.*

Proof: Suppose, first, that $\mathcal{I}$ is behaviorally syntactically protoalgebraic. Then, by Theorems 2004 and 2006, $A^{\mathcal{I},V}$ is a collection of witnessing transformations for the behavioral syntactic protoalgebraicity of $\mathcal{I}$. Therefore, for all $T \in \text{ThFam}(\mathcal{I})$, $A^{\mathcal{I},V}(T) = \Upsilon(T)$. Conversely, if $A^{\mathcal{I},V}(T) = \Upsilon(T)$, for all $T \in \text{ThFam}(\mathcal{I})$, then $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations $A^{\mathcal{I},V}$. ■

The connection between behavioral syntactic protoalgebraicity and behavioral protoalgebraicity passes through another property of the behavioral Suszko core that we term *Leibniz*.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. We say that the behavioral reflexive core $A^{\mathcal{I}}$ of $\mathcal{I}$ is **Leibniz** if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$,

$$\langle \phi, \psi \rangle \in \Upsilon_{\Sigma}(C(A_{\Sigma}^{\mathcal{I},v}[\phi, \psi])).$$

It is straightforward to show that, if $A^{\mathcal{I},V}$ has the modus ponens property in $\mathcal{I}$, then it is also Leibniz.

Proposition 2010 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $A^{\mathcal{I}}$ has the modus ponens in $\mathcal{I}$, then it is Leibniz.*

Proof: Suppose that $A^{\mathcal{I}}$ has the modus ponens in $\mathcal{I}$. Then, by Theorem 2006, $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations $A^{\mathcal{I},V}$. Thus, we obtain, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$,

$$\langle \phi, \psi \rangle \in \Upsilon_{\Sigma}(C(A_{\Sigma}^{\mathcal{I},v}[\phi, \psi])) \quad \text{iff} \quad A_{\Sigma}^{\mathcal{I},v}[\phi, \psi] \leq C(A_{\Sigma}^{\mathcal{I},v}[\phi, \psi]).$$

However, the condition of the right always holds, whence, we get that, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$, $\langle \phi, \psi \rangle \in \Upsilon_{\Sigma}(C(A_{\Sigma}^{\mathcal{I},v}[\phi, \psi]))$, i.e., $A^{\mathcal{I}}$ is Leibniz. ■

The opposite implication is not true in general. It holds, however, in behaviorally protoalgebraic behavioral π -institutions.

Proposition 2011 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behaviorally protoalgebraic behavioral π -institution based on $\mathbf{F}$. If $A^{\mathcal{I}}$ is Leibniz, then it has the modus ponens in $\mathcal{I}$.*

Proof: Suppose that $\mathcal{I}$ is behaviorally protoalgebraic and $A^{\mathcal{I}}$ is Leibniz. Let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi, \psi \in \text{SEN}_v^b(\Sigma)$, such that $\phi \in T_{\Sigma}$ and $A_{\Sigma}^{\mathcal{I},v}[\phi, \psi] \leq T$. Since $A^{\mathcal{I}}$ is Leibniz, we get that $\langle \phi, \psi \rangle \in \Upsilon_{\Sigma}(C(A_{\Sigma}^{\mathcal{I},v}[\phi, \psi]))$. Since $A_{\Sigma}^{\mathcal{I},v}[\phi, \psi] \leq T$, we get, by the hypothesis of behavioral protoalgebraicity, $\Upsilon(C(A_{\Sigma}^{\mathcal{I},v}[\phi, \psi])) \leq \Upsilon(T)$, whence, $\langle \phi, \psi \rangle \in \Upsilon_{\Sigma}(T)$. Hence, by the compatibility of $\Upsilon(T)$, with T , we get $\psi \in T_{\Sigma}$. We conclude that $\psi \in C_{\Sigma}(\phi, A_{\Sigma}^{\mathcal{I},v}[\phi, \psi])$ and, thus, $A^{\mathcal{I}}$ has the modus ponens in $\mathcal{I}$. ■

We close by formulating the exact relation between behavioral syntactic protoalgebraicity and behavioral protoalgebraicity.

$$\begin{aligned} & \text{Behavioral Syntactic Protoalgebraicity} \\ &= A^{\mathcal{I}} \text{ has the Modus Ponens} \\ &= A^{\mathcal{I}} \text{ Defines Behavioral Leibniz Congruence Systems} \\ &= \text{Behavioral Protoalgebraicity} + A^{\mathcal{I}} \text{ Leibniz} \end{aligned}$$

Theorem 2012 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally syntactically protoalgebraic if and only if it is behaviorally protoalgebraic and has a Leibniz behavioral reflexive core.*

Proof: If $\mathcal{I}$ is behaviorally syntactically protoalgebraic, then, by Theorem 2002, it is behaviorally protoalgebraic, by Theorem 2004, $A^{\mathcal{I}}$ has the modus ponens and, hence, by Proposition 2010, $A^{\mathcal{I}}$ is Leibniz.

Conversely, if $\mathcal{I}$ is behaviorally protoalgebraic and $A^{\mathcal{I}}$ is Leibniz, then, by Proposition 2011, $A^{\mathcal{I}}$ has the modus ponens in $\mathcal{I}$, whence, by Theorem 2006, $\mathcal{I}$ is behaviorally syntactically protoalgebraic. ■

27.5 Behavioral Truth Equationality

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$.

- $\mathcal{I}$ is **behaviorally completely reflective** (or **behaviorally c-reflective**, for short), if, for all $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$,

$$\bigcap_{T \in \mathcal{T}} \Upsilon(T) \leq \Upsilon(T') \quad \text{implies} \quad \bigcap_{T \in \mathcal{T}} T \leq T'.$$

- $\mathcal{I}$ is **behaviorally truth equational** if there exists $\tau = \{\tau^v : v \in V\}$, where, for all $v \in V$, $\tau^v = \{\tau^{v,u} : u \in V\}$ is a collection of natural transformations $\tau^{v,u} : \text{SEN}_v^b \times \prod_{i < \omega} \text{SEN}_{s_i}^b \rightarrow (\text{SEN}_u^b)^2$ in N^b , such that, for all $T \in \mathbf{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \text{SEN}_v^b(\Sigma)$,

$$\phi \in T_\Sigma \quad \text{iff} \quad \tau_\Sigma^v[\phi] \leq \Upsilon(T).$$

In this case, the collection τ forms a set of **witnessing transformations for the behavioral truth equationality of $\mathcal{I}$** .

We have the following alternative characterization of behavioral c-reflectivity, involving both the behavioral Suszko and the behavioral Leibniz operator.

Lemma 2013 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally c-reflective if and only if, for all $T, T' \in \text{ThFam}(\mathcal{I})$,*

$$\tilde{\Upsilon}(T) \leq \Upsilon(T') \quad \text{implies} \quad T \leq T'.$$

Proof: Suppose, first, that $\mathcal{I}$ is behaviorally c-reflective and let $T, T' \in \text{ThFam}(\mathcal{I})$, such that $\tilde{\Upsilon}(T) \leq \Upsilon(T')$. Then, we have $\bigcap \{\Upsilon(X) : T \leq X \in \text{FiFam}(\mathcal{I})\} \leq \Upsilon(T')$, whence, by behavioral c-reflectivity, $\bigcap \{X : T \leq X \in \text{ThFam}(\mathcal{I})\} \leq T'$, i.e., $T \leq T'$. Thus, the condition of the statement holds.

Assume, conversely, that the condition of the statement holds and let $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$, such that $\bigcap_{T \in \mathcal{T}} \Upsilon(T) \leq \Upsilon(T')$. Then we get

$$\tilde{\Upsilon}(\bigcap \mathcal{T}) \leq \bigcap \{\Upsilon(T) : T \in \mathcal{T}\} \leq \Upsilon(T').$$

Therefore, by the hypothesis, $\cap \mathcal{T} \leq T'$ and, hence, $\mathcal{I}$ is behaviorally c-reflective. ■

It is easy to see that behavioral truth equationality implies behavioral c-reflectivity.

Proposition 2014 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally truth equational, then it is behaviorally c-reflective.*

Proof: Suppose that $\mathcal{I}$ is behaviorally truth equational, with witnessing transformations $\tau = \{\tau^v : v \in V\}$, and let $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$, such that $\cap_{T \in \mathcal{T}} \Upsilon(T) \leq \Upsilon(T')$. Then, we have, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \text{SEN}_v^b(\Sigma)$,

$$\begin{aligned} \phi \in \cap_{T \in \mathcal{T}} T_\Sigma & \quad \text{iff} \quad \phi \in T_\Sigma, T \in \mathcal{T}, \\ & \quad \text{iff} \quad \tau_\Sigma^v[\phi] \leq \Upsilon(T), T \in \mathcal{T}, \\ & \quad \text{iff} \quad \tau_\Sigma^v[\phi] \leq \cap_{T \in \mathcal{T}} \Upsilon(T) \\ & \quad \text{implies} \quad \tau_\Sigma^v[\phi] \leq \Upsilon(T') \\ & \quad \text{iff} \quad \phi \in T'_\Sigma. \end{aligned}$$

Therefore, $\cap \mathcal{T} \leq T'$ and $\mathcal{I}$ is indeed behaviorally c-reflective. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. We define the **behavioral Suszko core** $\Sigma^\mathcal{I} = \{\Sigma^{\mathcal{I}, v} : v \in V\}$ of $\mathcal{I}$ by setting, for all $v \in V$,

$$\begin{aligned} \Sigma^{\mathcal{I}, v} = \{ \sigma : \text{SEN}_v^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow (\text{SEN}_u^b)^2, u \in V : \\ (\forall \Sigma \in |\mathbf{Sign}^b|)(\forall \phi \in \text{SEN}_v^b(\Sigma))(\sigma_\Sigma[\phi] \leq \tilde{\Upsilon}(C(\phi))) \} \end{aligned}$$

$\Sigma^\mathcal{I}$ is a pool for possible candidates witnessing the potential behavioral truth equationality of $\mathcal{I}$.

Lemma 2015 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally truth equational, with witnessing transformations τ , then $\tau \subseteq \Sigma^\mathcal{I}$.*

Proof: Suppose $\mathcal{I}$ is behaviorally truth equational, with witnessing transformations $\tau = \{\tau^v : v \in V\}$ and let $v \in V$, $\sigma \in \tau^v$, $\Sigma \in |\mathbf{Sign}^b|$ and $\phi \in \text{SEN}_v^b(\Sigma)$. Then, we have, for all $T \in \text{ThFam}(\mathcal{I})$, such that $\phi \in T_\Sigma$, $\sigma_\Sigma[\phi] \leq \Upsilon(T)$, whence

$$\sigma_\Sigma[\phi] \leq \bigcap \{ \Upsilon(T) : \phi \in T_\Sigma \} = \tilde{\Upsilon}(C(\phi)).$$

We conclude that $\sigma \in \Sigma^{\mathcal{I}, v}$. Therefore, $\tau \subseteq \Sigma^\mathcal{I}$. ■

The behavioral Suszko core $\Sigma^\mathcal{I}$ was devised to carry a sentence of visible sort into the behavioral Suszko congruence system of the theory family generated by it. Because of the monotonicity of the behavioral Suszko operator

and the fact that the behavioral Suszko operator is universally subsumed by the behavioral Leibniz operator, however, it turns out that the image of any behavioral theory family under the behavioral Suszko core always lies inside the behavioral Leibniz congruence system of the family.

Proposition 2016 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system, $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$, $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \text{SEN}_v^b(\Sigma)$. If $\phi \in T_\Sigma$, then*

$$\Sigma_\Sigma^{\mathcal{I},v}[\phi] \leq \Upsilon(T).$$

Proof: Let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \text{SEN}_v^b(\Sigma)$, such that $\phi \in T_\Sigma$. Then, we have

$$\begin{aligned} \Sigma_\Sigma^{\mathcal{I},v}[\phi] &\leq \tilde{\Upsilon}(C(\phi)) \quad (\text{definition of } \Sigma_\Sigma^{\mathcal{I}}) \\ &\leq \tilde{\Upsilon}(T) \quad (\text{monotonicity of } \tilde{\Upsilon}) \\ &\leq \Upsilon(T). \quad (\tilde{\Upsilon} \leq \Upsilon) \end{aligned}$$

This proves the conclusion. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. We say that the behavioral Suszko core $\Sigma^\mathcal{I}$ of $\mathcal{I}$ is **soluble** if, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \text{SEN}_v^b(\Sigma)$,

$$\Sigma_\Sigma^{\mathcal{I},v}[\phi] \leq \Upsilon(T) \quad \text{implies} \quad \phi \in T_\Sigma.$$

The solubility of the behavioral Suszko core is a necessary condition for a behavioral π -institution to be behaviorally truth equational.

Theorem 2017 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally truth equational, then $\Sigma^\mathcal{I}$ is soluble.*

Proof: Suppose $\mathcal{I}$ is behaviorally truth equational, with witnessing transformations $\tau = \{\tau^v : v \in V\}$. Then, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \text{SEN}_v^b(\Sigma)$, such that $\Sigma_\Sigma^{\mathcal{I},v}[\phi] \leq \Upsilon(T)$, we have, by Lemma 2015,

$$\tau_\Sigma^v[\phi] \leq \Sigma_\Sigma^{\mathcal{I},v}[\phi] \leq \Upsilon(T),$$

whence, by the fact that τ witnesses the behavioral truth equationality of $\mathcal{I}$, $\phi \in T_\Sigma$. Therefore, $\Sigma^\mathcal{I}$ is indeed soluble. ■

Conversely, the solubility of the behavioral Suszko core ensures that it can serve as a collection of witnessing transformations for the behavioral truth equationality of $\mathcal{I}$.

Theorem 2018 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If the behavioral Suszko core $\Sigma^\mathcal{I}$ is soluble, then $\mathcal{I}$ is behaviorally truth equational, with witnessing transformations $\Sigma^\mathcal{I}$.*

Proof: Let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \mathbf{SEN}_v^b(\Sigma)$. If $\phi \in T_\Sigma$, then, by Proposition 2016, $\Sigma_\Sigma^{\mathcal{I},v}[\phi] \leq \Upsilon(T)$. On the other hand, if $\Sigma_\Sigma^{\mathcal{I},v}[\phi] \leq \Upsilon(T)$, then, by the postulated solubility of $\Sigma^\mathcal{I}$, we get that $\phi \in T_\Sigma$. Hence, we have $\phi \in T_\Sigma$ if and only if $\Sigma_\Sigma^{\mathcal{I},v}[\phi] \leq \Upsilon(T)$, showing that $\Sigma^\mathcal{I}$ witnesses the behavioral truth equationality of $\mathcal{I}$. ■

We now have the following characterization of behavioral truth equationality depending on the behavior (in the ordinary sense) of the behavioral Suszko core.

$\mathcal{I}$ is Behaviorally Truth Equational $\longleftrightarrow \Sigma^\mathcal{I}$ is Soluble.

Theorem 2019 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally truth equational if and only if it has a soluble behavioral Suszko core.*

Proof: Necessity is by Theorem 2017, whereas sufficiency is proved in Theorem 2018. ■

We say that the behavioral Suszko core $\Sigma^\mathcal{I}$ of a behavioral π -institution $\mathcal{I} = \langle \mathbf{F}, C \rangle$ **defines theory families** if, for all $T \in \text{ThFam}(\mathcal{I})$, all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \mathbf{SEN}_v^b(\Sigma)$,

$$\phi \in T_\Sigma \quad \text{iff} \quad \Sigma_\Sigma^{\mathcal{I},v}[\phi] \leq \Upsilon(T).$$

Then, another characterization of behavioral truth equationality is the following:

$\mathcal{I}$ is Behaviorally Truth Equational $\longleftrightarrow \Sigma^\mathcal{I}$ Defines Theory Families.

Theorem 2020 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally truth equational if and only if its behavioral Suszko core $\Sigma^\mathcal{I}$ defines theory families.*

Proof: $\mathcal{I}$ is behaviorally truth equational if and only if, by Theorem 2019 $\Sigma^\mathcal{I}$ is soluble if and only if, by Proposition 2016 and the definition of solubility, $\Sigma^\mathcal{I}$ defines theory families in $\mathcal{I}$. ■

We have just seen that behavioral truth equationality of a behavioral π -institution is equivalent to the solubility property of its behavioral Suszko core. The solubility property implies another property, which, taking after

similar work in preceding chapters, we call *adequacy*. It says, roughly speaking, that in a behavioral π -institution the category of natural transformations is rich enough to determine behavioral Suszko congruence systems in terms of the behavioral Leibniz congruence systems that it selects by inclusion. The property of adequacy is motivated by the following property that holds in every behavioral π -institution.

Proposition 2021 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. For all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \mathbf{SEN}_v^b(\Sigma)$,*

$$\bigcap \{ \Upsilon(T) : \Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \Upsilon(T) \} \leq \tilde{\Upsilon}(C(\phi)).$$

Proof: Let $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \mathbf{SEN}_v^b(\Sigma)$. Then we have, for all $T \in \text{ThFam}(\mathcal{I})$,

$$\begin{aligned} \phi \in T_{\Sigma} & \text{ implies } \Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \tilde{\Upsilon}(T) \\ & \text{ implies } \Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \Upsilon(T). \end{aligned}$$

Thus, we get

$$\begin{aligned} \bigcap \{ \Upsilon(T) : \Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \Upsilon(T) \} & \leq \bigcap \{ \Upsilon(T) : \Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \tilde{\Upsilon}(T) \} \\ & \leq \bigcap \{ \Upsilon(T) : \phi \in T_{\Sigma} \} \\ & = \tilde{\Upsilon}(C(\phi)). \end{aligned}$$

Hence, the inclusion in the statement holds. ■

The reverse inclusion is not always guaranteed, but, when it holds, we say that the behavioral Suszko core of $\mathcal{I}$ is *adequate*. The terminology is intended to convey the idea that $\Sigma_{\Sigma}^{\mathcal{I},v}[\phi]$ suffices to determine the theory families whose behavioral Leibniz congruence systems form a “covering” of the behavioral Suszko congruence system corresponding to the theory family $C(\phi)$.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. The behavioral Suszko core $\Sigma^{\mathcal{I}}$ of $\mathcal{I}$ is **adequate** if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi \in \mathbf{SEN}_v^b(\Sigma)$,

$$\tilde{\Upsilon}(C(\phi)) \leq \bigcap \{ \Upsilon(T) : \Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \Upsilon(T) \}.$$

We can prove immediately that the solubility of the behavioral Suszko core implies its adequacy.

Proposition 2022 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If the behavioral Suszko core $\Sigma^{\mathcal{I}}$ is soluble, then it is adequate.*

Proof: Suppose that $\Sigma^{\mathcal{I}}$ is soluble. Let $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \text{SEN}_v^b(\Sigma)$. By solubility, for all $T \in \text{ThFam}(\mathcal{I})$,

$$\Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \Upsilon(T) \quad \text{implies} \quad \phi \in T_{\Sigma}.$$

Hence, we get

$$\tilde{\Upsilon}(C(\phi)) \leq \tilde{\Upsilon}(T) \leq \Upsilon(T).$$

Since this holds, for all $T \in \text{ThFam}(\mathcal{I})$, such that $\Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \Upsilon(T)$, we get that

$$\tilde{\Upsilon}(C(\phi)) \leq \bigcap \{\Upsilon(T) : \Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \Upsilon(T)\}.$$

Therefore, $\Sigma^{\mathcal{I}}$ is adequate. $\blacksquare$

Conversely, if a behavioral π -institution is behaviorally c-reflective, then the adequacy of its behavioral Suszko core is sufficient to give its solubility.

Proposition 2023 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally c-reflective and the behavioral Suszko core $\Sigma^{\mathcal{I}}$ is adequate, then $\Sigma^{\mathcal{I}}$ is soluble.*

Proof: Suppose that $\mathcal{I}$ is behaviorally c-reflective and that the behavioral Suszko core $\Sigma^{\mathcal{I}}$ is adequate. Let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \text{SEN}_v^b(\Sigma)$, such that $\Sigma_{\Sigma}^{\mathcal{I},v}[\phi] \leq \Upsilon(T)$. Then, by the adequacy of the Suszko core, we get that $\tilde{\Upsilon}(C(\phi)) \leq \Upsilon(T)$, whence, by behavioral c-reflectivity and Lemma 2013, we get $C(\phi) \leq T$, i.e., $\phi \in T_{\Sigma}$. We conclude that $\Sigma^{\mathcal{I}}$ is soluble. $\blacksquare$

We can now show that a behavioral π -institution is behaviorally truth equational if and only if it is behaviorally c-reflective and has an adequate behavioral Suszko core.

$$\begin{aligned} &\text{Behavioral Truth Equationality} \\ &= \Sigma^{\mathcal{I}} \text{ Soluble} \\ &= \Sigma^{\mathcal{I}} \text{ Defines Theory Families} \\ &= \text{Behavioral c-Reflectivity} + \Sigma^{\mathcal{I}} \text{ Adequate} \end{aligned}$$

Theorem 2024 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally truth equational if and only if it is behaviorally c-reflective and has an adequate behavioral Suszko core.*

Proof: If $\mathcal{I}$ is behaviorally truth equational, then, by Proposition 2014, it is behaviorally c-reflective, by Theorem 2017, its behavioral Suszko core is soluble and, by Proposition 2022, its behavioral Suszko core is adequate. Conversely, if $\mathcal{I}$ is behaviorally c-reflective with an adequate behavioral Suszko core, then, by Proposition 2023, its behavioral Suszko core is soluble and, hence, by Theorem 2018, $\mathcal{I}$ is behaviorally truth equational. $\blacksquare$

27.6 Behavioral Weak Algebraizability

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is **behaviorally WF algebraizable** if it is behaviorally protoalgebraic and behaviorally c-reflective.

Lemma 2025 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally protoalgebraic, then, for all $\{T^i : i \in I\} \subseteq \text{ThFam}(\mathcal{I})$,*

$$\Upsilon\left(\bigcap_{i \in I} T^i\right) = \bigcap_{i \in I} \Upsilon(T^i).$$

Proof: Suppose $\mathcal{I}$ is behaviorally protoalgebraic and let $\{T^i : i \in I\} \subseteq \text{ThFam}(\mathcal{I})$. Then, by hypothesis, $\Upsilon(\bigcap_{i \in I} T^i) \leq \bigcap_{i \in I} \Upsilon(T^i)$. On the other hand, $\bigcap_{i \in I} \Upsilon(T^i)$ is a congruence system on $\mathbf{F}$. Moreover, it is easy to see that it is compatible with $\bigcap_{i \in I} T^i$. Hence, by the maximality property of the behavioral Leibniz congruence system, we get $\bigcap_{i \in I} \Upsilon(T^i) \leq \Upsilon(\bigcap_{i \in I} T^i)$. ■

Lemma 2026 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally protoalgebraic and the behavioral Leibniz operator is injective, then, for all $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$,*

$$\bigcap_{T \in \mathcal{T}} \Upsilon(T) \leq \Upsilon(T') \quad \text{implies} \quad \bigcap \mathcal{T} \leq T'.$$

Proof: Suppose that $\mathcal{I}$ is behaviorally protoalgebraic and that the behavioral Leibniz operator is injective. Let $\mathcal{T} \cup \{T'\} \subseteq \text{ThFam}(\mathcal{I})$, such that $\bigcap_{T \in \mathcal{T}} \Upsilon(T) \leq \Upsilon(T')$. Then we have

$$\begin{aligned} \Upsilon(\bigcap \mathcal{T} \cap T') &= \bigcap_{T \in \mathcal{T}} \Upsilon(T) \cap \Upsilon(T') \quad (\text{Lemma 2025}) \\ &= \bigcap_{T \in \mathcal{T}} \Upsilon(T) \quad (\text{hypothesis}) \\ &= \Upsilon(\bigcap \mathcal{T}). \quad (\text{Lemma 2025}) \end{aligned}$$

Hence, by the injectivity of the behavioral Leibniz operator, $\bigcap \mathcal{T} \cap T' = \bigcap \mathcal{T}$, showing that $\bigcap \mathcal{T} \leq T'$. ■

Proposition 2027 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally WF algebraizable if and only if the behavioral Leibniz operator is monotone and injective on $\text{ThFam}(\mathcal{I})$.*

Proof: Suppose $\mathcal{I}$ is behaviorally WF algebraizable. Then by definition, it is behaviorally protoalgebraic and behaviorally c-reflective. Thus, the behavioral Leibniz operator is monotone and c-reflective on $\text{ThFam}(\mathcal{I})$, whence it is monotone and, a fortiori, injective on $\text{ThFam}(\mathcal{I})$.

If, conversely, Υ is monotone and injective on $\text{ThFam}(\mathcal{I})$, then it is monotone and, by Lemma 2026, c -reflective on $\text{ThFam}(\mathcal{I})$. Hence, $\mathcal{I}$ is behaviorally protoalgebraic and behaviorally c -reflective, i.e., by definition, it is behaviorally WF algebraizable. ■

Another characterization of behavioral WF algebraizability asserts that it is equivalent to the existence of an isomorphism from the complete lattice of theory families of a behavioral π -institution to the complete lattice of the $\mathcal{I}$ -congruence systems on its underlying behavioral algebraic system.

We need the following preparatory definitions.

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$.

- Let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system. A family $T = \{T_\Sigma\}_{\Sigma \in |\mathbf{Sign}|}$, with $T_\Sigma \subseteq \bigcup_{v \in V} \text{SEN}_v(\Sigma)$, for all $\Sigma \in |\mathbf{Sign}|$, is called an $\mathcal{I}$ -**filter family** of $\mathcal{A}$ if, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\Phi \cup \{\phi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)$, such that $\phi \in C_\Sigma(\Phi)$,

$$\alpha_\Sigma(\Phi) \subseteq T_{F(\Sigma)} \quad \text{implies} \quad \alpha_\Sigma(\phi) \in T_{F(\Sigma)}.$$

The collection of all $\mathcal{I}$ -filter families of $\mathcal{A}$ is denoted by $\text{FiFam}^\mathcal{I}(\mathcal{A})$. It is a complete lattice, whose corresponding closure operator will be denoted by $C^{\mathcal{I}, \mathcal{A}}$.

- An $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ is an $\mathcal{I}$ -**algebraic system** if there exists $T \in \text{FiFam}^\mathcal{I}(\mathcal{A})$, such that $\tilde{\Upsilon}(T) = \Delta^\mathcal{A}$. The collection of all $\mathcal{I}$ -algebraic systems is denoted by $\text{AlgSys}(\mathcal{I})$.
- Given an $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$, a congruence system $\theta \in \text{ConSys}(\mathcal{A})$ is a $\mathcal{I}$ -**congruence system** on $\mathcal{A}$ if $\mathcal{A}/\theta \in \text{AlgSys}(\mathcal{I})$. The collection of all $\mathcal{I}$ -congruence systems on $\mathcal{A}$ is denoted by $\text{ConSys}^\mathcal{I}(\mathcal{A})$.

Lemma 2028 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T = \{T_\Sigma\}_{\Sigma \in |\mathbf{Sign}|}$, such that, for all $\Sigma \in |\mathbf{Sign}|$, $T_\Sigma \subseteq \bigcup_{v \in V} \text{SEN}_v(\Sigma)$,*

$$T \in \text{FiFam}^\mathcal{I}(\mathcal{A}) \quad \text{iff} \quad \alpha^{-1}(T) \in \text{ThFam}(\mathcal{I}).$$

Proof: Let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system and $T = \{T_\Sigma\}_{\Sigma \in |\mathbf{Sign}|}$, such that, for all $\Sigma \in |\mathbf{Sign}|$, $T_\Sigma \subseteq \bigcup_{v \in V} \text{SEN}_v(\Sigma)$.

Assume, first, that $T \in \text{FiFam}^\mathcal{I}(\mathcal{A})$ and let $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \text{SEN}_v^b(\Sigma)$, such that $\phi \in C_\Sigma(\alpha_\Sigma^{-1}(T_{F(\Sigma)}))$. Then, by the definition of $C^{\mathcal{I}, \mathcal{A}}$, we get

$$\alpha_\Sigma(\phi) \in C_{F(\Sigma)}^{\mathcal{I}, \mathcal{A}}(\alpha_\Sigma(\alpha_\Sigma^{-1}(T_{F(\Sigma)}))) \subseteq C_{F(\Sigma)}^{\mathcal{I}, \mathcal{A}}(T_{F(\Sigma)}) = T_{F(\Sigma)}.$$

Hence, we get $\phi \in \alpha_\Sigma^{-1}(T_{F(\Sigma)})$ and we conclude that $\alpha^{-1}(T) \in \text{ThFam}(\mathcal{I})$.

Suppose, conversely, that $\alpha^{-1}(T) \in \text{ThFam}(\mathcal{I})$ and let $\Sigma \in |\mathbf{Sign}^b|$, $\Phi \cup \{\phi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)$, such that $\phi \in C_\Sigma(\Phi)$ and $\alpha_\Sigma(\Phi) \subseteq T_{F(\Sigma)}$. Then $\Phi \subseteq \alpha_\Sigma^{-1}(T_{F(\Sigma)})$, whence, since $\phi \in C_\Sigma(\Phi)$ and $\alpha^{-1}(T) \in \text{ThFam}(\mathcal{I})$, we get that $\phi \in \alpha_\Sigma^{-1}(T_{F(\Sigma)})$, i.e., $\alpha_\Sigma(\phi) \in T_{F(\Sigma)}$. We conclude that $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. ■

Lemma 2029 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. For every $\mathbf{F}$ -algebraic system $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ and all $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$,*

$$\Upsilon(\alpha^{-1}(T)) = \alpha^{-1}(\Upsilon^{\mathcal{A}}(T)).$$

Proof: Let $\mathcal{A} = \langle \mathbf{A}, \langle F, \alpha \rangle \rangle$ be an $\mathbf{F}$ -algebraic system and $T \in \text{FiFam}^{\mathcal{I}}(\mathcal{A})$. Then, for all $\Sigma \in |\mathbf{Sign}^b|$, $s \in S$ and $\phi, \psi \in \text{SEN}_s^b(\Sigma)$, we have $\langle \phi, \psi \rangle \in \Upsilon_\Sigma(\alpha^{-1}(T))$ if and only if, for all $\sigma : \text{SEN}_s^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b$, with $v \in V$, all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma')$,

$$\begin{aligned} \sigma_{\Sigma'}(\text{SEN}_s^b(f)(\phi), \vec{\chi}) &\in \alpha_{\Sigma'}^{-1}(T_{F(\Sigma')}) \\ \text{iff } \sigma_{\Sigma'}(\text{SEN}_s^b(f)(\psi), \vec{\chi}) &\in \alpha_{\Sigma'}^{-1}(T_{F(\Sigma')}) \end{aligned}$$

iff

$$\begin{aligned} \alpha_{\Sigma'}(\sigma_{\Sigma'}(\text{SEN}_s^b(f)(\phi), \vec{\chi})) &\in T_{F(\Sigma')} \\ \text{iff } \alpha_{\Sigma'}(\sigma_{\Sigma'}(\text{SEN}_s^b(f)(\psi), \vec{\chi})) &\in T_{F(\Sigma')} \end{aligned}$$

iff

$$\begin{aligned} \sigma_{F(\Sigma')}^{\mathcal{A}}(\alpha_{\Sigma'}(\text{SEN}_s^b(f)(\phi)), \alpha_{\Sigma'}(\vec{\chi})) &\in T_{F(\Sigma')} \\ \text{iff } \sigma_{F(\Sigma')}^{\mathcal{A}}(\alpha_{\Sigma'}(\text{SEN}_s^b(f)(\psi)), \alpha_{\Sigma'}(\vec{\chi})) &\in T_{F(\Sigma')} \end{aligned}$$

iff

$$\begin{aligned} \sigma_{F(\Sigma')}^{\mathcal{A}}(\text{SEN}_s(F(f))(\alpha_\Sigma(\phi)), \alpha_{\Sigma'}(\vec{\chi})) &\in T_{F(\Sigma')} \\ \text{iff } \sigma_{F(\Sigma')}^{\mathcal{A}}(\text{SEN}_s(F(f))(\alpha_\Sigma(\psi)), \alpha_{\Sigma'}(\vec{\chi})) &\in T_{F(\Sigma')} \end{aligned}$$

if and only if, by the surjectivity of $\langle F, \alpha \rangle$, $\langle \alpha_\Sigma(\phi), \alpha_\Sigma(\psi) \rangle \in \Upsilon_{F(\Sigma)}^{\mathcal{A}}(T)$ if and only if $\langle \phi, \psi \rangle \in \alpha_{F(\Sigma)}^{-1}(\Upsilon_{F(\Sigma)}^{\mathcal{A}}(T))$. We now conclude that $\Upsilon(\alpha^{-1}(T)) = \alpha^{-1}(\Upsilon^{\mathcal{A}}(T))$. ■

Now we have the following characterization result for behavioral WF algebraizability.

Theorem 2030 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. $\mathcal{I}$ is behaviorally WF algebraizable if and only if $\Upsilon : \text{ThFam}(\mathcal{I}) \rightarrow \text{ConSys}^{\mathcal{I}}(\mathcal{F})$ is an order isomorphism.*

Proof: Suppose that $\mathcal{I}$ is behaviorally WF algebraizable. Then, by Proposition 2027, Υ is monotone and injective on $\mathbf{ThFam}(\mathcal{I})$. Moreover, by definition of behavioral WF algebraizability Υ is c-reflective on $\mathbf{ThFam}(\mathcal{I})$ and, therefore, a fortiori, it is order reflecting. Thus, it suffices to show that it is surjective, i.e., onto $\mathbf{ConSys}^{\mathcal{I}}(\mathcal{F})$. To this end, let $\theta \in \mathbf{ConSys}^{\mathcal{I}}(\mathcal{F})$. By definition, $\mathcal{F}/\theta \in \mathbf{AlgSys}(\mathcal{I})$. Thus, there exists $T^\theta \in \mathbf{FiFam}^{\mathcal{I}}(\mathcal{F}/\theta)$, such that $\tilde{\Upsilon}^{\mathcal{F}/\theta}(T^\theta) = \Delta^{\mathcal{F}/\theta}$. Let $\langle I, \pi^\theta \rangle : \mathcal{F} \rightarrow \mathcal{F}/\theta$ be the quotient morphism. Now, by Lemma 2028, $\pi^{\theta^{-1}}(T^\theta) \in \mathbf{ThFam}(\mathcal{I})$ and

$$\begin{aligned} \Upsilon(\pi^{\theta^{-1}}(T^\theta)) &= \pi^{\theta^{-1}}(\Upsilon^{\mathcal{F}/\theta}(T^\theta)) \quad (\text{Lemma 2029}) \\ &= \pi^{\theta^{-1}}(\Delta^{\mathcal{F}/\theta}) \quad (\text{hypothesis and protoalgebraicity}) \\ &= \theta. \quad (\text{set theory}) \end{aligned}$$

Therefore, Υ is surjective and, hence, an order isomorphism from $\mathbf{ThFam}(\mathcal{I})$ onto $\mathbf{ConSys}^{\mathcal{I}}(\mathcal{F})$.

Conversely, if $\Upsilon : \mathbf{ThFam}(\mathcal{I}) \rightarrow \mathbf{ConSys}^{\mathcal{I}}(\mathcal{F})$ is an order isomorphism, then it is monotone and injective on $\mathbf{ThFam}(\mathcal{I})$ and, hence, by Proposition 2027, $\mathcal{I}$ is behaviorally WF algebraizable. ■

Finally, we close by providing a relation between behavioral algebraizability and behavioral WF algebraizability. Our first step in this direction is to show that behavioral algebraizability implies both behavioral syntactic protoalgebraicity and behavioral truth equationality. To be able to show this, we start by proving two technical results asserting that the binary relation family induced on the underlying behavioral algebraic system of a given behaviorally algebraizable π -institution by one of the two interpretations witnessing the behavioral algebraizability is a congruence system having a compatibility property.

Lemma 2031 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally algebraizable via a conjugate pair $(\tau, \rho) : \mathcal{I} \rightleftarrows \mathcal{I}^K$, for some class K of $\mathbf{F}$ -algebraic systems, then, for all $\Sigma \in |\mathbf{Sign}^b|$, all $v \in V$ and all $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$,*

$$\psi \in C_\Sigma(\phi, \rho_\Sigma^v[\phi, \psi]).$$

Proof: Assume $T \in \mathbf{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$, such that $\phi \in T_\Sigma$ and $\rho_\Sigma^v[\phi, \psi] \leq T$. Then we get that

$$\tau_\Sigma^v[\phi] \leq C^K(\tau_\Sigma[T]) \quad \text{and} \quad \langle \phi, \psi \rangle \in C^K(\tau_\Sigma[T]).$$

Hence, by the definition of C^K , we get that $\tau_\Sigma^v[\psi] \leq C^K(\tau_\Sigma[T])$ and, therefore, $\psi \in C_\Sigma(T) = T_\Sigma$. We conclude that $\psi \in C_\Sigma(\phi, \rho_\Sigma^v[\phi, \psi])$. ■

Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behaviorally algebraizable π -institution, as witnessed by the

conjugate pair $(\tau, \rho) : \mathcal{I} \rightleftarrows \mathcal{I}^K$, for some class K of $\mathbf{F}$ -algebraic systems. We define a class $\rho^+ = \{\rho^{+,s} : s \in S\}$ of natural transformations in N^b by setting, for all $s \in S$, $\rho^{+,s}$ to be the collection of all natural transformations in N^b of the form

$$\sigma^v(\sigma(x, \vec{z}), \sigma(y, \vec{z}), \vec{w}),$$

where

$$\sigma : \text{SEN}_s^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b, \quad \sigma^v \in \rho^v, \quad v \in V.$$

Moreover, for all $T \in \text{ThFam}(\mathcal{I})$, we define $\rho^{++}(T) = \{\rho_\Sigma^{++}(T)\}_{\Sigma \in |\mathbf{Sign}^b|}$, where, for all $\Sigma \in |\mathbf{Sign}^b|$, we set

$$\rho_\Sigma^{++}(T) = \{\rho_\Sigma^{+,s}(T) : s \in S\}$$

by letting, for all $\Sigma \in |\mathbf{Sign}^b|$, all $s \in S$ and all $\phi, \psi \in \text{SEN}_s^b(\Sigma)$,

$$\langle \phi, \psi \rangle \in \rho_\Sigma^{+,s}(T) \quad \text{iff} \quad \rho_\Sigma^{+,s}[\phi, \psi] \leq T.$$

Proposition 2032 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally algebraizable via a conjugate pair $(\tau, \rho) : \mathcal{I} \rightleftarrows \mathcal{I}^K$, for some class K of $\mathbf{F}$ -algebraic systems, then, for all $T \in \text{ThFam}(\mathcal{I})$, $\rho^{++}(T)$ is a congruence system on $\mathbf{F}$ compatible with T .*

Proof: Let $T \in \text{ThFam}(\mathcal{I})$ and $\Sigma \in |\mathbf{Sign}^b|$. Then $\rho_\Sigma^{++}(T)$ is reflexive, symmetric and transitive, by the definition of $\mathcal{I}^K$, the definition of ρ^+ and the fact that ρ is an interpretation.

E.g., to show symmetry, we let $\Sigma \in |\mathbf{Sign}^b|$, $s \in S$ and $\phi, \psi \in \text{SEN}_s^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \rho_\Sigma^{+,s}(T)$. Then, we have $\rho_\Sigma^{+,s}[\phi, \psi] \leq T$ and, thus, for all $\sigma : \text{SEN}_s^b \times \prod_{i=1}^k \text{SEN}_{s_i}^b \rightarrow \text{SEN}_v^b$ in N^b , $\Sigma' \in |\mathbf{Sign}^b|$, $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and $\vec{\chi} \in \prod_{i=1}^k \text{SEN}_{s_i}^b(\Sigma')$,

$$\rho_{\Sigma'}^v[\sigma_{\Sigma'}(\text{SEN}_s^b(f)(\phi), \vec{\chi}), \sigma_{\Sigma'}(\text{SEN}_s^b(f)(\psi), \vec{\chi})] \leq T.$$

This, however, implies that

$$\rho_{\Sigma'}^v[\sigma_{\Sigma'}(\text{SEN}_s^b(f)(\psi), \vec{\chi}), \sigma_{\Sigma'}(\text{SEN}_s^b(f)(\phi), \vec{\chi})] \leq T.$$

Reversing the steps above, we get that $\langle \psi, \phi \rangle \in \rho_\Sigma^{+,s}(T)$. Hence, $\rho_\Sigma^{++}(T)$ is symmetric.

Moreover, it has, by the same considerations, the congruence property. Finally, it is a system by the definition of $\rho^{++}(T)$. It is compatible with T due to Lemma 2031. ■

Corollary 2033 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally algebraizable via a conjugate pair $(\tau, \rho) : \mathcal{I} \rightleftarrows \mathcal{I}^K$, for some class K of $\mathbf{F}$ -algebraic systems, then, for all $v \in V$, $\rho^{+,v}(T) = \rho^{*,v}(T)$.*

Proof: Let $v \in V$ and suppose $\Sigma \in |\mathbf{Sign}^b|$, $\phi, \psi \in \mathbf{SEN}_v^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \rho_\Sigma^{+,v}(T)$. Then $\rho_\Sigma^{+,v}[\phi, \psi] \leq T$. But, by definition, $\rho \subseteq \rho^+$, whence, $\rho_\Sigma^v[\phi, \psi] \leq T$. Therefore, $\langle \phi, \psi \rangle \in \rho_\Sigma^{*,v}(T)$.

Suppose, conversely, that $\langle \phi, \psi \rangle \in \rho_\Sigma^{*,v}(T)$. Then $\rho_\Sigma^v[\phi, \psi] \leq T$. But this implies that, for all $\sigma : \mathbf{SEN}_v^b \times \prod_{i=1}^k \mathbf{SEN}_{s_i}^b \rightarrow \mathbf{SEN}_u^b$, with $u \in V$, in N^b , all $\Sigma' \in |\mathbf{Sign}^b|$, all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$ and all $\vec{\chi} \in \prod_{i=1}^k \mathbf{SEN}_{s_i}^b(\Sigma')$,

$$\rho_{\Sigma'}^u[\sigma_{\Sigma'}(\mathbf{SEN}_v^b(f)(\phi), \vec{\chi}), \sigma_{\Sigma'}(\mathbf{SEN}_v^b(f)(\psi), \vec{\chi})] \leq T.$$

Therefore, we conclude that $\rho_\Sigma^{+,v}[\phi, \psi] \leq T$, giving that $\langle \phi, \psi \rangle \in \rho_\Sigma^{+,v}(T)$. ■

Proposition 2032 allows us to establish that the congruence system $\rho^{+,v}(T)$ coincides with the behavioral Leibniz congruence system $\Upsilon(T)$ of T in $\mathcal{I}$.

Theorem 2034 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally algebraizable via a conjugate pair $(\tau, \rho) : \mathcal{I} \rightleftarrows \mathcal{I}^K$, for some class K of $\mathbf{F}$ -algebraic systems, then, for all $T \in \text{ThFam}(\mathcal{I})$,*

$$\rho^{+,v}(T) = \Upsilon(T).$$

Proof: Let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $s \in S$ and $\phi, \psi \in \mathbf{SEN}_s^b(\Sigma)$, such that $\langle \phi, \psi \rangle \in \Upsilon_\Sigma(T)$. Since $\Upsilon(T)$ is a congruence system, we get, for all $\Sigma' \in |\mathbf{Sign}^b|$ and all $f \in \mathbf{Sign}^b(\Sigma, \Sigma')$, $\langle \mathbf{SEN}_s^b(f)(\phi), \mathbf{SEN}_s^b(f)(\psi) \rangle \in \Upsilon_{\Sigma'}(T)$. Since $\Upsilon(T)$ is a congruence system, we now get, for all $\sigma^v \in \rho^v$, all $\sigma : \mathbf{SEN}_s^b \times \prod_{i=1}^k \mathbf{SEN}_{s_i}^b \rightarrow \mathbf{SEN}_v^b$ in N^b , and all $\vec{\chi} \in \prod_{i=1}^k \mathbf{SEN}_{s_i}^b(\Sigma')$, $\vec{\xi} \in \prod_{j < \omega} \mathbf{SEN}_{s_j}^b(\Sigma')$,

$$\begin{aligned} & \langle \sigma_{\Sigma'}^v(\sigma_{\Sigma'}(\mathbf{SEN}_s^b(f)(\phi), \vec{\chi}), \sigma_{\Sigma'}(\mathbf{SEN}_s^b(f)(\psi), \vec{\chi}), \vec{\xi}), \\ & \sigma_{\Sigma'}^v(\sigma_{\Sigma'}(\mathbf{SEN}_s^b(f)(\phi), \vec{\chi}), \sigma_{\Sigma'}(\mathbf{SEN}_s^b(f)(\psi), \vec{\chi}), \vec{\xi}) \rangle \in \Upsilon_{\Sigma'}(T). \end{aligned}$$

On the other hand, we know that $\rho_\Sigma^{+,s}[\phi, \psi] \leq T$, whence, by the compatibility of $\Upsilon(T)$ with T , we get that $\rho_\Sigma^{+,s}[\phi, \psi] \leq T$. Therefore, $\langle \phi, \psi \rangle \in \rho_\Sigma^{+,s}(T)$.

Conversely, since, by Proposition 2032, $\rho^{+,v}(T)$ is a congruence system on $\mathbf{F}$ that is compatible with T , we get, by the maximality property of the behavioral Leibniz operator, $\rho^{+,v}(T) \leq \Upsilon(T)$. ■

Now, we prove that behavioral algebraizability implies both behavioral syntactic protoalgebraicity and behavioral truth equationality.

Theorem 2035 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally algebraizable, then it is both behaviorally syntactically protoalgebraic and behaviorally truth equational.*

Proof: Suppose $\mathcal{I}$ is behaviorally algebraizable via the conjugate pair $(\tau, \rho) : \mathcal{I} \rightleftarrows \mathcal{I}^K$, for some class K of $\mathbf{F}$ -algebraic systems.

Let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi, \psi \in \text{SEN}_v^b(\Sigma)$. Then we have

$$\begin{aligned} \langle \phi, \psi \rangle \in \Upsilon_\Sigma(T) & \text{ iff } \langle \phi, \psi \rangle \in \rho_\Sigma^{+*}(T) \quad (\text{Theorem 2034}) \\ & \text{ iff } \langle \phi, \psi \rangle \in \rho_\Sigma^*(T) \quad (\text{by Corollary 2033}) \\ & \text{ iff } \rho_\Sigma[\phi, \psi] \leq T. \quad (\text{definition of } \rho^*) \end{aligned}$$

Therefore, $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations ρ .

Finally, let $T \in \text{ThFam}(\mathcal{I})$, $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and $\phi \in \text{SEN}_v^b(\Sigma)$. Then, we have

$$\begin{aligned} \phi \in T_\Sigma & \text{ iff } \rho_\Sigma[\tau_\Sigma[\phi]] \leq T \quad ((\tau, \rho) \text{ conjugate pair}) \\ & \text{ iff } \tau_\Sigma[\phi] \subseteq \rho_\Sigma^*(T) \quad (\text{definition of } \rho^*) \\ & \text{ iff } \tau_\Sigma[\phi] \subseteq \rho_\Sigma^{+*}(T) \quad (\text{by Corollary 2033}) \\ & \text{ iff } \tau_\Sigma[\phi] \leq \Upsilon(T). \quad (\text{Theorem 2034}) \end{aligned}$$

Therefore, $\mathcal{I}$ is behaviorally truth equational, with witnessing transformations τ . ■

We show, next, that, conversely, behavioral syntactic protoalgebraicity and behavioral truth equationality guarantee behavioral algebraizability.

Theorem 2036 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\text{SEN}_s^b\}_H^{V, V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. If $\mathcal{I}$ is behaviorally syntactically protoalgebraic and behaviorally truth equational, then it is behaviorally algebraizable.*

Proof: Suppose that $\mathcal{I}$ is behaviorally syntactically protoalgebraic, with witnessing transformations ρ , and behaviorally truth equational, with witnessing transformations τ . Then, we have, for all $\Sigma \in |\mathbf{Sign}^b|$ and all $\Phi \cup \{\phi\} \subseteq \bigcup_{v \in V} \text{SEN}_v^b(\Sigma)$,

$$\begin{aligned} \phi \in C_\Sigma(\Phi) & \text{ iff } \phi \in \bigcap \{T_\Sigma : \Phi \subseteq T_\Sigma\} \\ & \text{ iff } \tau_\Sigma[\phi] \leq \bigcap \{\Upsilon(T) : \tau_\Sigma[\Phi] \leq \Upsilon(T)\} \\ & \text{ iff } \tau_\Sigma[\phi] \leq C^K(\tau_\Sigma[\Phi]). \end{aligned}$$

Moreover, for all $\Sigma \in |\mathbf{Sign}^b|$, $v \in V$ and all $\phi, \psi \in \text{SEN}_v^b(\Sigma)$,

$$\begin{aligned} \langle \phi, \psi \rangle \in \Upsilon_\Sigma(T) & \text{ iff } \rho_\Sigma^v[\phi, \psi] \leq T \\ & \text{ iff } \tau[\rho_\Sigma^v[\phi, \psi]] \leq \Upsilon(T). \end{aligned}$$

Hence, we have that $C^K(\phi \approx \psi) = C^K(\tau[\rho_\Sigma^v[\phi, \psi]])$.

We conclude, by Proposition 1998, that $\mathcal{I}$ is equivalent to $\mathcal{I}^K$ and, therefore, $\mathcal{I}$ is behaviorally algebraizable. ■

Now we can formulate the main characterization theorem:

Theorem 2037 *Let $\mathbf{F} = \langle \mathbf{Sign}^b, \{\mathbf{SEN}_s^b\}_H^{V,V^*}, N^b \rangle$ be a behavioral algebraic system and $\mathcal{I} = \langle \mathbf{F}, C \rangle$ a behavioral π -institution based on $\mathbf{F}$. The following statements are equivalent:*

- (i) $\mathcal{I}$ is behaviorally algebraizable;
- (ii) $\mathcal{I}$ is behaviorally syntactically protoalgebraic and behaviorally truth equational;
- (iii) $\mathcal{I}$ is behaviorally WF algebraizable (i.e., behaviorally protoalgebraic and behaviorally c-reflective) and has both a Leibniz behavioral reflexive core and an adequate behavioral Suszko core.

Proof: If $\mathcal{I}$ is behaviorally algebraizable, then, by Theorem 2035, it is both behaviorally syntactically protoalgebraic and behaviorally truth equational. If $\mathcal{I}$ is behaviorally syntactically protoalgebraic and behaviorally truth equational, then, by Theorems 2012 and 2024, it is behaviorally protoalgebraic, behaviorally c-reflective and has both a Leibniz behavioral reflexive core and an adequate behavioral Suszko core. Finally, if $\mathcal{I}$ is behaviorally WF algebraizable, with a Leibniz behavioral reflexive core and an adequate behavioral Suszko core, then, by Theorems 2012 and 2024, it is behaviorally syntactically protoalgebraic and behaviorally truth equational, whence, by Theorem 2036, it is behaviorally algebraizable. ■

Chapter 28

List of Problems

A Few Words

We gather some of the problems arising at various places in the main text. They are listed in order of occurrence and no suggestion is made about the degree of their difficulty. In fact, I have not put the same amount of effort in tackling all problems in the list. However, solving them, regardless of difficulty, will definitively inform the theory and the context in which they appear.

Each problem consists of a **task**, which is, in my estimation, the most likely outcome. The **alternative** is also explicitly given. When a task seems a bit involved and I am less certain about its status, I inserted in the list some special subtasks that might be easier to tackle. So, not all problems appearing in the list are independent, and, when aware, I tried to state this explicitly.

As for the format, here is a generic sample, before presenting the list:

Problem X (Chapter 00, Example 00)

This is a special case of Problem Y.

Task: Construct a π -institution in class A but not in class B.

Alternative: Prove that every π -institution in A is also in B.

The List

Problem 1 (Chapter 11, Example 811)

Task: Construct a π -institution which is syntactically prealgebraic, but not syntactically protoalgebraic.

Alternative: Prove that every syntactically prealgebraic π -institution is also syntactically protoalgebraic.

Problem 2 (Chapter 11, Example 820)

Task: Construct a Suszko truth equational π -institution which is not Leibniz truth equational.

Alternative: Prove that every Suszko truth equational π -institution is also Leibniz truth equational.

Proving the conjecture (Task) would show that the truth equationality hierarchy of Chapter 11, Section 11.6 consists of two different classes. Proving the Alternative would reduce the hierarchy to a single class.

Problem 3 (Chapter 11, Example 872)

Task: Construct a π -institution which is left truth equational, but not (family) truth equational.

Alternative: Prove that every left truth equational π -institution is also (family) truth equational.

Problem 4 (Chapter 11, Example 890)

Task: Construct a π -institution which is system truth equational, but not left truth equational.

Alternative: Prove that every system truth equational π -institution is also left truth equational.

Problem 5 (Chapter 12, Example 936)

Task: Construct a π -institution which is syntactically weakly algebraizable, but not syntactically weakly family algebraizable.

Alternative: Prove that every syntactically weakly algebraizable π -institution is also syntactically weakly family algebraizable.

Problem 6 (Chapter 12, Example 955)

Task: Construct a π -institution which is syntactically weakly left c-reflective prealgebraizable, but not syntactically weakly algebraizable.

Alternative: Prove that every syntactically weakly left c-reflective prealgebraizable π -institution is also syntactically weakly algebraizable.

Problem 7 (Chapter 12, Example 956)

Task: Construct a π -institution which is syntactically weakly system prealgebraizable, but not syntactically weakly left c-reflective prealgebraizable.

Alternative: Prove that every syntactically weakly system prealgebraizable π -institution is also syntactically weakly left c-reflective prealgebraizable.

Problem 8 (Chapter 13, Example 990)

Task: Construct a π -institution which is syntactically preequivalential, but not syntactically equivalential.

Alternative: Prove that every syntactically preequivalential π -institution is also syntactically equivalential.

Problem 9 (Chapter 13, Example 1021)

Task: Construct a π -institution which is strongly left truth equational, but not strongly (family) truth equational.

Alternative: Prove that every strongly left truth equational π -institution is also strongly (family) truth equational.

Problem 10 (Chapter 13, Example 1037)

Task: Construct a π -institution which is strongly system truth equational, but not strongly left truth equational.

Alternative: Prove that every strongly system truth equational π -institution is also strongly left truth equational.

Problem 11 (Chapter 13, Example 1045)

Task: Construct a π -institution which is syntactically left prealgebraizable

but not syntactically left antiprealgebraizable.

Alternative: Prove that every syntactically left prealgebraizable π -institution is also syntactically left antiprealgebraizable.

Problem 12 (Chapter 13, Example 1046)

Task: Construct a π -institution which is syntactically left antiprealgebraizable but not syntactically left prealgebraizable.

Alternative: Prove that every syntactically left antiprealgebraizable π -institution is also syntactically left prealgebraizable.

Together with the preceding problem, this Task would establish that syntactic left prealgebraizability and syntactic left antiprealgebraizability are incomparable and that they are both strictly dominated by syntactic strong left prealgebraizability.

Problem 13 (Chapter 13, Example 1061)

Task: Construct a π -institution which is syntactically system prealgebraizable but not syntactically system antiprealgebraizable.

Alternative: Prove that every syntactically system prealgebraizable π -institution is also syntactically system antiprealgebraizable.

Problem 14 (Chapter 13, Example 1062)

Task: Construct a π -institution which is syntactically system antiprealgebraizable but not syntactically system prealgebraizable.

Alternative: Prove that every syntactically system antiprealgebraizable π -institution is also syntactically system prealgebraizable.

Together with the preceding problem, this Task would establish that syntactic system prealgebraizability and syntactic system antiprealgebraizability are incomparable and that they are both strictly dominated by syntactic strong system prealgebraizability.

Problem 15 (Chapter 13, Example 1070)

Task: Construct a π -institution which is syntactically strongly system prealgebraizable but neither syntactically left prealgebraizable nor syntactically left antiprealgebraizable.

Alternative: Prove that every syntactically strongly system prealgebraizable π -institution is also syntactically left prealgebraizable and/or syntactically left antiprealgebraizable.

This Task would establish that the three classes of the syntactic left prealgebraizability subhierarchy are properly contained, one by one, in the corresponding classes of the syntactic system prealgebraizability subhierarchy.

Problem 16 (Chapter 13, Example 1078)

Task: Construct a π -institution which is syntactically family algebraizable but not syntactically family antialgebraizable.

Alternative: Prove that every syntactically family algebraizable π -institution is also syntactically family antialgebraizable.

Problem 17 (Chapter 13, Example 1079)

Task: Construct a π -institution which is syntactically family antialgebraizable but not syntactically family algebraizable.

Alternative: Prove that every syntactically family antialgebraizable π -institution is also syntactically family algebraizable.

Together with the preceding problem, this Task would establish that syntactic family algebraizability and syntactic family antialgebraizability are incomparable and that they are both strictly dominated by syntactic strong family algebraizability.

Problem 18 (Chapter 13, Example 1094)

Task: Construct a π -institution which is syntactically algebraizable but not syntactically antialgebraizable.

Alternative: Prove that every syntactically algebraizable π -institution is also syntactically antialgebraizable.

Problem 19 (Chapter 13, Example 1095)

Task: Construct a π -institution which is syntactically antialgebraizable but not syntactically algebraizable.

Alternative: Prove that every syntactically antialgebraizable π -institution is also syntactically algebraizable.

Together with the preceding problem, this Task would establish that syntactic algebraizability and syntactic antialgebraizability are incomparable and that they are both strictly dominated by syntactic strong algebraizability.

Problem 20 (Chapter 13, Example 1103)

Task: Construct a π -institution which is syntactically strongly algebraizable but neither syntactically family algebraizable nor syntactically family antialgebraizable.

Alternative: Prove that every syntactically strongly algebraizable π -institution is also syntactically family algebraizable and/or syntactically family antialgebraizable.

This Task would establish that the three classes of the syntactic family algebraizability subhierarchy are properly contained, one by one, in the corresponding classes of the syntactic algebraizability subhierarchy.

Problem 21 (Chapter 13, Example 1104)

Task: Construct a π -institution which is syntactically strongly left prealgebraizable but neither syntactically family algebraizable nor syntactically family antialgebraizable.

Alternative: Prove that every syntactically strongly left prealgebraizable π -institution is also syntactically family algebraizable and/or syntactically family antialgebraizable.

This Task would establish that the three classes of the syntactic algebraizability subhierarchy are properly contained, one by one, in the corresponding classes of the syntactic left prealgebraizability subhierarchy.

Problem 22 (Chapter 14, Example 1198)

Task: Construct a π -institution which is roughly left truth equational, but not roughly/narrowly (family) truth equational.

Alternative: Prove that every roughly left truth equational π -institution is also roughly/narrowly (family) truth equational.

Problem 23 (Chapter 14, Example 1199)

Task: Construct a π -institution which is roughly left truth equational, but not narrowly left truth equational.

Alternative: Prove that every roughly left truth equational π -institution is also narrowly left truth equational.

Problem 24 (Chapter 14, Example 1200)

Task: Construct a π -institution which is narrowly left truth equational, but not roughly system truth equational.

Alternative: Prove that every narrowly left truth equational π -institution is also roughly system truth equational.

Problem 25 (Chapter 14, Example 1201)

Task: Construct a π -institution which is roughly/narrowly (family) truth equational, but not roughly left truth equational.

Alternative: Prove that every roughly/narrowly (family) truth equational π -institution is also roughly left truth equational.

Problem 26 (Chapter 14, Example 1202)

Task: Construct a π -institution which is roughly/narrowly (family) truth equational, but not narrowly left truth equational.

Alternative: Prove that every roughly/narrowly (family) truth equational π -institution is also narrowly left truth equational.

Together with the preceding four problems, this Task would clarify the status of the rough/narrow truth equationality hierarchy, as shown in the diagram at the end of Section 14.6.

Problem 27 (Chapter 15, Theorem 1233)

Task: Give an intrinsic necessary and sufficient condition for an arbitrary narrowly family monotone π -institution to be syntactically narrowly family monotone.

Problem 28 (Chapter 15, Theorem 1248)

Task: Give an intrinsic necessary and sufficient condition for an arbitrary narrowly system monotone π -institution to be syntactically narrowly system monotone.

Problem 29 (Chapter 15, Theorem 1260)

Task: Give an intrinsic necessary and sufficient condition for an arbitrary narrowly right monotone π -institution to be syntactically narrowly right monotone.

Problem 30 (Chapter 15, Example 1262)

Task: Construct a π -institution which is syntactically narrowly family monotone, but not syntactically narrowly right monotone.

Alternative: Prove that every syntactically narrowly family monotone π -institution is also syntactically narrowly right monotone.

Problem 31 (Chapter 15, Example 1263)

Task: Construct a π -institution which is syntactically narrowly right monotone, but not syntactically narrowly family monotone.

Alternative: Prove that every syntactically narrowly right monotone π -institution is also syntactically narrowly family monotone.

Together with the preceding problem, this Task would clarify the status of the syntactic narrow monotonicity hierarchy, shown in the diagram at the end of Section 15.4.

Problem 32 (Chapter 16, Example 1271)

Task: Construct a π -institution which is syntactically family regularly prealgebraic, but not syntactically system regularly protoalgebraic.

Alternative: Prove that every syntactically family regularly prealgebraic π -institution is also syntactically system regularly protoalgebraic.

Problem 33 (Chapter 16, Example 1272)

Task: Construct a π -institution which is syntactically system regularly protoalgebraic, but not syntactically family regularly prealgebraic.

Alternative: Prove that every syntactically system regularly protoalgebraic π -institution is also syntactically family regularly prealgebraic.

Together with the preceding problem, this Task would clarify the status of the syntactic regular pre/protoalgebraicity hierarchy, shown in one of the diagrams in Section 16.3.

Problem 34 (Chapter 16, Example 1278)

Task: Construct a π -institution which is syntactically family regularly pre-equivalential, but not syntactically system regularly equivalential.

Alternative: Prove that every syntactically family regularly pre-equivalen-

tial π -institution is also syntactically system regularly equivalential.

Problem 35 (Chapter 16, Example 1279)

Task: Construct a π -institution which is syntactically system regularly equivalential, but not syntactically family regularly preequivalential.

Alternative: Prove that every syntactically system regularly equivalential π -institution is also syntactically family regularly preequivalential.

Together with the preceding problem, this Task would clarify the status of the syntactic regular (pre)equivalentiality hierarchy, shown in one of the diagrams in Section 16.4.

Problem 36 (Chapter 16, Example 1286)

Task: Construct a π -institution which is syntactically left assertional, but not syntactically family assertional.

Alternative: Prove that every syntactically left assertional π -institution is also syntactically family assertional.

Problem 37 (Chapter 16, Example 1287)

Task: Construct a π -institution which is syntactically system assertional, but not syntactically left assertional.

Alternative: Prove that every syntactically system assertional π -institution is also syntactically left assertional.

Together with the preceding problem, this Task would clarify the status of the syntactic assertional hierarchy, shown in one of the diagrams in Section 16.5.

Problem 38 (Chapter 16, Example 1296)

Task: Construct a π -institution which is syntactically regularly weakly left prealgebraizable, but not syntactically regularly weakly family prealgebraizable.

Alternative: Prove that every syntactically regularly weakly left prealgebraizable π -institution is also syntactically regularly weakly family prealgebraizable.

Problem 39 (Chapter 16, Example 1297)

Task: Construct a π -institution which is syntactically regularly weakly system prealgebraizable, but not syntactically regularly weakly left prealgebraizable.

Alternative: Prove that every syntactically regularly weakly system prealgebraizable π -institution is also syntactically regularly weakly left prealgebraizable.

Together with the preceding problem, this Task would clarify the status of the syntactic regular weak prealgebraizability hierarchy, shown in one of the diagrams in Section 16.6.

Problem 40 (Chapter 16, Example 1299)

Task: Construct a π -institution which is syntactically family regularly protoalgebraic, but not syntactically regularly weakly system prealgebraizable.

Alternative: Prove that every syntactically family regularly protoalgebraic π -institution is also syntactically regularly weakly system prealgebraizable.

Problem 41 (Chapter 16, Example 1301)

Task: Construct a π -institution which is syntactically family assertional, but not syntactically regularly weakly system prealgebraizable.

Alternative: Prove that every syntactically family assertional π -institution is also syntactically regularly weakly system prealgebraizable.

Problem 42 (Chapter 16, Example 1303)

Task: Construct a π -institution which is syntactically weakly family algebraizable, but not syntactically regularly weakly system prealgebraizable.

Alternative: Prove that every syntactically weakly family algebraizable π -institution is also syntactically regularly weakly system prealgebraizable.

Problem 43 (Chapter 16, Example 1314)

Task: Construct a π -institution which is syntactically regularly weakly system algebraizable, but not syntactically regularly weakly family algebraizable.

Alternative: Prove that every syntactically regularly weakly system algebraizable π -institution is also syntactically regularly weakly family algebraizable.

Problem 44 (Chapter 16, Example 1315)

Task: Construct a π -institution which is syntactically regularly weakly left prealgebraizable, but not syntactically regularly weakly system algebraizable.

Alternative: Prove that every syntactically regularly weakly left prealgebraizable π -institution is also syntactically regularly weakly system algebraizable.

Problem 45 (Chapter 16, Example 1326)

Task: Construct a π -institution which is syntactically regularly system algebraizable, but not syntactically regularly family algebraizable.

Alternative: Prove that every syntactically regularly system algebraizable π -institution is also syntactically regularly family algebraizable.

Problem 46 (Chapter 16, Example 1327)

Task: Construct a π -institution which is syntactically regularly left prealgebraizable, but not syntactically regularly system algebraizable.

Alternative: Prove that every syntactically regularly left prealgebraizable π -institution is also syntactically regularly system algebraizable.

Problem 47 (Chapter 16, Example 1328)

Task: Construct a π -institution which is syntactically regularly system prealgebraizable, but not syntactically regularly left prealgebraizable.

Alternative: Prove that every syntactically regularly system prealgebraizable π -institution is also syntactically regularly left prealgebraizable.

Together with the preceding two problems, this Task would clarify the status of the syntactic regular (pre)algebraizability hierarchy, shown in one of the diagrams in Section 16.8.

Problem 48 (Chapter 16, Example 1330)

Task: Construct a π -institution which is syntactically family regularly equivalential, but not syntactically regularly system prealgebraizable.

Alternative: Prove that every syntactically family regularly equivalential π -institution is also syntactically regularly system prealgebraizable.

Problem 49 (Chapter 16, Example 1332)

Task: Construct a π -institution which is syntactically regularly weakly family algebraizable, but not syntactically regularly system prealgebraizable.

Alternative: Prove that every syntactically regularly weakly family algebraizable π -institution is also syntactically regularly system prealgebraizable.

Problem 50 (Chapter 16, Example 1334)

Task: Construct a π -institution which is syntactically family algebraizable, but not syntactically regularly system prealgebraizable.

Alternative: Prove that every syntactically family algebraizable π -institution is also syntactically regularly system prealgebraizable.

Index of Symbols

- $(\alpha, \beta) : \mathcal{K} \rightleftharpoons \mathcal{K}'$ Conjugate Pair of Inverse Interpretations Between π -Structures $\mathcal{K}$ and $\mathcal{K}'$, 946
 $B^{\mathcal{I}}$ Binary Reflexive Core of a π -Institution $\mathcal{I}$, 996
 $C(T)$ Theory Family Generated by T , 174
 $C \leq C'$ Extension Order on π -Institutions, 175
 C^T Closure Subsystem of C with Theorem System T , 175
 C^K Closure Family Associated with the Class K of **F**-Algebraic Systems, 885
 C^M Closure System Induced by a Class M of Matrix Families, 178
 $C^{\mathcal{I}, \mathcal{A}}(T)$ Least $\mathcal{I}$ -Filter Family of $\mathcal{A}$ Including T , 181
 $C^{\mathcal{I}, \mathfrak{A}}$ Closure Family Generated by a Matrix Family, 189
 $C^{K, \tau}$ Assertional Closure System Defined by τ^b -Pointed Class K of Algebraic Systems, 1266
 $C^{\mathfrak{A}}$ Closure System Induced by a Matrix Family, 178
 D^K Closure Operator Associated with a Class K of **F**-Algebraic Systems, 160
 D^K Equational Consequence Relative to a Class K of **F**-Algebraic Systems, 231
 D^f Finitary Companion of D , 713
 $D^{\mathcal{I}*}$ Closure Family Associated with $\text{ConSys}^{\mathcal{I}*}(\mathcal{I})$, 964
 $D^{\mathcal{I}\bullet}$ Closure Family Associated with $\text{ConSys}^{\mathcal{I}\bullet}(\mathcal{I})$, 979
 $E_{\Sigma}(\vec{\phi})$ Collection of Values of Finitary Natural Transformations in E at $\vec{\phi}$, 213
 $E_{\Sigma}[\vec{\phi}]$ Sentence Family Induced by Collection E of Natural Transformations (with Parameters) and $\vec{\phi}$, 213
 $F^{\mathcal{I}}$ Lindenbaum Core of a π -Institution $\mathcal{I}$, 1135
 $I_{\Sigma, \Sigma'}^b[\vec{\phi}]$ Σ' -Component of the Sentence Family $I_{\Sigma}^b[\vec{\phi}]$, 745
 $I_{\Sigma}^b(\vec{\phi})$ Image of a tuple $\vec{\phi}$ of Sentences Under a Set I^b of Natural Transformations, 745
 $I_{\Sigma}^b[\vec{\phi}]$ Family of Images of $\vec{\phi}$ Under I^b , 745
 $K^{\mathcal{I}}$ Closure Family Associated with $\text{ThSys}(\mathcal{I})$, 968
 $L^{\mathcal{I}}$ Left Suszko Core of a π -Institution $\mathcal{I}$, 915
 $L^{\mathcal{I}}$ System Suszko Core of a π -Institution $\mathcal{I}$, 915
 $L^{\mathcal{I}\sharp}$ Narrow Left Suszko Core of a π -Institution $\mathcal{I}$, 1103

- N^θ Category of Natural Transformations on SEN^θ , 147
 $P^b \subseteq N^b$ Collection of All Natural Transformations Satisfying P , 224
 $R^\mathcal{I}$ Reflexive Core of a π -Institution $\mathcal{I}$, 862
 $R^{\mathcal{I}^\sharp}$ Rough Reflexive Core of a π -Institution $\mathcal{I}$, 1149
 $R^{\mathcal{I}^s}$ Narrow System Reflexive Core of a π -Institution $\mathcal{I}$, 1159
 $S^b : (\text{SEN}^b)^\omega \rightarrow (\text{SEN}^b)^\ell$ Collection of Natural Transformations in N^b , 222
 $S^\mathcal{I}$ Suszko Core of a π -Institution $\mathcal{I}$, 901
 $S^{\mathcal{I}^\sharp}$ Rough Suszko Core of a π -Institution $\mathcal{I}$, 1084
 $X \leq_{lf} Y$ X is a Locally Finite Subfamily of Y , 226
 $X_{i^{\mathcal{I}, \mathcal{A}, n}}(X)$ n -th Step in Filter Family Generation, 229
 $Z^\mathcal{I}$ System Core of a π -Institution $\mathcal{I}$, 930
 $Z^{\mathcal{I}^\sharp}$ Rough System Core of a π -Institution $\mathcal{I}$, 1121
 $[R_\Sigma^{\mathcal{I}^\sharp}[\phi, \psi]]$ Poset of Theory Families in $\text{ThFam}^\sharp(\mathcal{I})$ Containing $R_\Sigma^{\mathcal{I}^\sharp}[\phi, \psi]$, 1154
 $[R_\Sigma^{\mathcal{I}^s}[\phi, \psi]]$ Poset of Theory Systems in $\text{ThSys}^\sharp(\mathcal{I})$ Containing $R_\Sigma^{\mathcal{I}^s}[\phi, \psi]$, 1164
 $\Delta^\mathbf{A}$ Identity Congruence System on $\mathbf{A}$, 146
 Λ Frege Operator, 197
 Λ Global Frege Operator, 197
 $\Lambda(T)$ Frege Relation System of a Sentence Family T , 197
 $\Lambda^\mathbf{A}(T)$ Frege Relation System of T on $\mathbf{A}$, 198
